Development and Verification of Software for Flight Safety Critical Systems H. Afzali, A. Mattissek, LITEF DER HELLE GMBH FREIBURG IM BREISGAU (GERMANY F R), 1991 In Flight Safety Critical Systems where the lives of people and or mission success is depending on

errors in the Computer Software Components can have a catastrophic impact on the safety. The requirements for the software development and maintenance of Flight Safety Critical systems differ in some aspects from the systems which do not fall into this category. The reason for these requirements is to produce the right product at the very beginning of the system's usage and to ensure special attention is paid throughout the whole service life of the equipment. The reliability and safety requirements can reach a point where testing alone is not sufficient. Consequently, adequate control mechanisms have to be applied. The software configuration management, quality control, verification and validation must be rigorously adhered to. For the development of the equipment software, a set of development standards and additional procedures for the implementation of Safety Critical Functions are defined. LITEF applied the standards and procedures for the development of the Inertial Measurement Unit which is a part of the Flight Control System and Seat Sequencer Unit which is part of the Ejection Seat. In this paper, some critical technology needs are described for supporting the development and verification process of such systems and the activities which have to be performed during the development phases for identifying, assessing and eliminating or minimizing hazards in a systematic way.

Certification Processes for Safety-Critical and Mission-Critical Aerospace Software Stacy Nelson, NASA Technical Reports Server (Ntrs), 2013-08. This document is a quick reference guide with an overview of the processes required to certify safety critical and mission critical flight software at selected NASA centers and the FAA. Researchers and software developers can use this guide to jumpstart their understanding of how to get new or enhanced software onboard an aircraft or spacecraft. The introduction contains aerospace industry definitions of safety and safety critical software as well as the current rationale for certification of safety critical software. The Standards for Safety Critical Aerospace Software section lists and describes current standards including NASA standards and RTCA DO 178B. The Mission Critical versus Safety Critical software section explains the difference between two important classes of software: safety critical software involving the potential for loss of life due to software failure and mission critical software involving the potential for aborting a mission due to software failure. The DO 178B Safety critical Certification Requirements section describes special processes and methods required to obtain a safety critical certification for aerospace software flying on vehicles under auspices of the FAA. The final two sections give an overview of the certification process used at Dryden Flight Research Center and the approval process at the Jet Propulsion Lab JPL.

A System-Theoretic Safety Engineering Approach for Software-Intensive Systems Asim Ali Ahmed Abdulkhaleq, 2017-02-23. Software safety is a crucial aspect during the development of modern safety critical systems. However, safety is a system level property and therefore must be considered at the system level to ensure the whole system's safety. In the software development process, formal verification and functional testing are complementary approaches which are used to verify the functional correctness of software; however, even perfectly reliable software could lead to an accident.

The correctness of software cannot ensure the safe operation of safety critical software systems Therefore developing safety critical software requires a more systematic software and safety engineering process that enables the software and safety engineers to recognize the potential software risks For this purpose this dissertation introduces a comprehensive safety engineering approach based on STPA for Software Intensive Systems called STPA SwISs which provides seamless STPA safety analysis and software safety verification activities to allow the software and safety engineers to work together during the software development for safety critical systems and help them to recognize the associated software risks at the system level

Functional Safety and Proof of Compliance Thor Myklebust, Tor Stålhane, 2022-01-03 This book aims to facilitate and improve development work related to all documents and information required by functional safety standards Proof of Compliance PoC is important for the assessor and certification bodies when called up to confirm that the manufacturer has developed a software system according to the required safety standards While PoC documents add functionality to the product neither for the developer nor for the customer they do add confidence and trust to the product and ease certification and as such are important for the product s value In spite of this added value the documentation needed for PoC is often developed late in the project and in a haphazard manner This book aims at developers assessors certification bodies and purchasers of safety instrumented systems and informs the reader about the most important PoC documents A typical PoC

documentation encompasses 50 to 200 documents several of which are named in the safety standards e g 82 documents in IEC 61508 2010 series 101 documents in EN 5012X series and 106 work products in ISO 26262 2018 series These documents also include further references typically one to twenty of them and the total number of pages developed by the manufacturer varies between 2000 and 10000 pages The book provides guidance and examples what to include in the relevant plans and documents

A Quality Assurance Model for Airborne Safety-critical Software Habib A. El Sabbagh, 2006

Software applications in which failure may result in possible catastrophic consequences on human life are classified as safety critical These applications are widely used in a variety of fields and systems such as airborne systems nuclear reactors control and medical diagnostic equipment Unfortunately the world has seen several accidents and tragedies caused by software failure error or where such failure error was part of the problem This thesis looks into safety critical software embedded in airborne systems It proposes a lifecycle specially modeled for the development of safety critical software in aerospace and in compliance with the DO 178B standard and a software quality assurance SQA model based on a set of four acceptance criteria that builds quality into safety critical software throughout its development The thesis also provides frameworks and guidelines for the implementation of the proposed SQA model in addition to sets of rules defining how to assess the software development with respect to the four acceptance criteria

Formal Methods in the Development of Safety Critical Software Systems, 1991 As the use of computers in critical control systems such as aircraft controls medical instruments defense systems missile controls and nuclear power plants has increased concern for the safety of those systems has also grown Much of this concern has focused on the software component of those computer based systems This is primarily due to historical experience with software systems that often exhibit larger numbers of errors than their hardware counterparts and the fact that the consequences of a software error may endanger human life property or the environment A number of different techniques have been used to address the issue of software safety Some are standard software engineering techniques aimed at reducing the number of faults in a software product such as reviews and walkthroughs Others including fault tree analysis are based on identifying and reducing hazards This report examines the role of one such technique formal methods in the development of software for safety critical systems The use of formal methods to increase the safety of software systems is based on their role in reducing the possibility of software errors that could lead to hazards The use of formal methods in the development of software systems is controversial Proponents claim that the use of formal methods can eliminate errors from the software development process and produce programs that are probably correct Opponents claim that they are difficult to learn and that their use increases development costs unacceptably This report discusses the potential of formal methods for reducing failures in safety critical software systems

National Aeronautics and Space Administration, 2019-01-14 We need well founded means of determining whether software is fit for use in safety critical applications While software in industries such as aviation has an excellent safety record the fact that software flaws have contributed to deaths illustrates the need for justifiably high confidence in software It is often argued that software is fit for safety critical use because it conforms to a standard for software in safety critical systems But little is known about whether such standards work Reliance upon a standard without knowing whether it works is an experiment without collecting data to assess the standard this experiment is unplanned This paper reports on a workshop intended to explore how standards could practicably be assessed Planning the Unplanned Experiment Assessing the Efficacy of Standards for Safety Critical Software AESSCS was held on 13 May 2014 in conjunction with the European Dependable Computing Conference EDCC We summarize and elaborate on the workshop's discussion of the topic including both the presented positions and the dialogue that ensued NASA TM 2015 218804 L 20575 NF1676L 21790 Graydon Patrick J and Holloway C Michael Langley Research Center *Quality First* E.
