Ignition Systems for Gasoline Engines Michael Günther, 2018-12-03 In addition to increasing electrification forecasts show a worldwide increase in the number of gasoline engines being produced Rising industrialization will likely lead to 120 million new registrations at least 75% of them for vehicles based on combustion engines by the year 2030 Ambitious climate targets will remain a chimera as long as the gasoline engine is not adapted to help significantly reduce carbon emissions In addition to the requirements of the established markets we must be prepared for new challenges in emerging economic regions in particular Engines require greater optimization while remaining sufficiently robust to meet the demands of use all around the world In addition to the Miller combustion cycle the industry needs engines that employ strongly charged diluted combustion to achieve efficiencies significantly above 40% Instrumental in this will be ignition processes with great potential to shift ignition limits *Verbrennungskontrollierte Erwaermung des Brennraums zur Emissionsreduktion waehrend des Kaltstarts - Untersuchungen zu Emissionen und zur Flammenausbreitung* Titus, Fabian, 2019-02-05 This work describes the influence of catalytic converter heating strategies on the emissions during heating operation as well as during the subsequent load demand at different engine start temperatures A novel strategy is presented that provides heating of the combustion chamber without decreasing the catalyst converter heating significantly The studies were carried out on a gasoline engine Emissions were examined in detail In addition the flame propagation is evaluated experimentally
