Advanced Physicochemical Treatment Processes Lawrence K. Wang, Yung-Tse Hung, Nazih K. Shamas, 2007-11-10 The past thirty years have witnessed a growing worldwide desire that positive actions be taken to restore and protect the environment from the degrading effects of all forms of pollution air water soil and noise Because pollution is a direct or indirect consequence of waste the seemingly idealistic demand for zero discharge can be construed as an unrealistic demand for zero waste However as long as waste continues to exist we can only attempt to abate the subsequent pollution by converting it to a less noxious form Three major questions usually arise when a particular type of pollution has been identified 1 How serious is the pollution 2 Is the technology to abate it available and 3 Do the costs of abatement justify the degree of abatement achieved This book is one of the volumes of the Handbook of Environmental Engineering series The principal intention of this series is to help readers formulate answers to the last two

questions above The traditional approach of applying tried and true solutions to specific pollution problems has been a major contributing factor to the success of environmental engineering and has accounted in large measure for the establishment of a methodology of pollution control However the realization of the ever increasing complexity and interrelated nature of current environmental problems renders it imperative that intelligent planning of pollution abatement systems be undertaken

Effect of Algal Biofilm and Operational Conditions on Nitrogen Removal in Waste Stabilization Ponds Mohammed Babu, 2011-05-18 Discharge of nutrient rich wastewater causes eutrophication of surface water therefore wastewater treatment before discharge is required Wastewater stabilization ponds are low cost technology used by developing countries but not effective in nitrogen removal due to low nitrifier biomass in the water column Introduction of surface area for attachment of nitrifiers has therefore been proposed This thesis reports the performance of pilot scale wastewater stabilization ponds fitted with baffles The effect of baffles on nitrogen removal under tropical and two operational conditions was investigated Under TKN BOD ratio of 0.67 the baffled ponds performed better in nitrogen removal than the control pond Total nitrogen mass balances showed that nitrification denitrification algal uptake and sedimentation were principle nitrogen removal mechanisms in biofilm waste stabilization ponds This study shows the potential of biofilms in improving nitrogen removal in wastewater stabilization ponds The BOD and TSS concentrations were sufficiently low to permit for reuse in irrigation If the objective is reuse and optimization of resources the effluents from the ponds had sufficient nitrogen content for use in agriculture
