

Radar (Radio detection and ranging) is an electro-magnetic systems for the detection and location of reflecting objects such as aircraft, ships, space craft, vehicles, people and natural environment.

Basic Principle of Radar

Range to a Target

The range to a target is determined by the time T_R it takes the radar signal to travel to the target and back. EM energy in free space travels with a speed of $c = 3 \times 10^8$ m/s. \therefore The time for a signal to travel to the target located at a range R and returns back to the radar is $2R/c$.

$$\therefore \text{Range}, R = \frac{c T_R}{2} \quad \therefore T_R = \frac{2R}{c}$$

Maximum Unambiguous Range

* Second time around echoes / multiple time around echoes.

The range beyond which targets appear as second time around echoes is the maximum
