Control and Dynamic Systems V50: Robust Control System Techniques and Applications C.T. Leonides,2012-12-02 Control and Dynamic Systems Advances in Theory and Applications Volume 50 Robust Control System Techniques and Applications Part 1 of 2 is a two volume sequence devoted to the issues and application of robust control systems techniques This volume is composed of 10 chapters and begins with a presentation of the important techniques for dealing with conflicting design objectives in control systems The subsequent chapters describe the robustness techniques of systems using differential difference equations the design of a wide class of robust nonlinear systems the techniques for dealing with the problems resulting from the use of observers in robust systems design and the effective techniques for the robust control on non linear time varying of tracking control systems with uncertainties These topics are followed by discussions of the effective techniques for the robust control on non linear time varying of tracking control systems with uncertainties and for incorporating adaptive control techniques into a non adaptive robust control design Other chapters present techniques for achieving exponential and robust stability for a rather general class of nonlinear systems techniques in modeling uncertain dynamics for robust control systems design and techniques for the optimal synthesis of these systems The last chapters provide a generalized eigenproblem solution for both singular and nonsingular system cases These chapters also look into the stability robustness design for discrete time systems This book will be of value to process and systems engineers designers and researchers

Control and Dynamic Systems V34: Advances in Control Mechanics Part 1 of 2 C.T. Leonides,2012-12-02 Control and Dynamic Systems Advances in Theory and Applications Volume 34 Advances in Control Mechanics Part 1 of 2 presents the fundamental aspects of mechanical systems control theory This book deals with microburst a severe meteorological condition significant to aircraft control Organized into seven chapters this volume begins with an overview of the problem of stable control of an aircraft subjected to windshear caused by microburst This text then examines the results concerning control of an aircraft under windshear conditions Other chapters consider the robust control problem using the variable structure control method This book discusses as well the problem of finding zeros of a nonlinear vector function by using methods of dynamical systems analysis The final chapter deals with the role of singularities and their effect on the global trait of dynamical systems This book is a valuable resource for mechanical and materials engineers Research workers and students will also find this book useful

Maximum Principle and Dynamic Programming Viscosity Solution Approach Bing Sun,Bao-Zhu Guo,Zhen-Zhen Tao,2025-08-02 This book is concerned with optimal control problems of dynamical systems described by partial differential equations PDEs The content covers the

theory and numerical algorithms starting with open loop control and ending with closed loop control It includes Pontryagin's maximum principle and the Bellman dynamic programming principle based on the notion of viscosity solution The Bellman dynamic programming method can produce the optimal control in feedback form making it more appealing for online implementations and robustness The determination of the optimal feedback control law is of fundamental importance in optimal control and can be argued as the Holy Grail of control theory The book is organized into five chapters Chapter 1 presents necessary mathematical knowledge Chapters 2 and 3 Part 1 focus on the open loop control while Chapter 4 and 5 Part 2 focus on the closed loop control In this monograph we incorporate the notion of viscosity solution of PDE with dynamic programming approach The dynamic programming viscosity solution DPVS approach is then used to investigate optimal control problems In each problem the optimal feedback law is synthesized and numerically demonstrated The last chapter presents multiple algorithms for the DPVS approach including an upwind finite difference scheme with the convergence proof It is worth noting that the dynamic systems considered are primarily of technical or biologic origin which is a highlight of the book This book is systematic and self contained It can serve the expert as a ready reference for control theory of infinite dimensional systems These chapters taken together would also make a one semester course for graduate with first courses in PDE constrained optimal control
