**Processing and Preservation Technology** Bal Govind Dubey, 2016      *Modern Technology on Food Preservation (2nd Edition)* NPCS Board, 2012-06-02 Food Preservation has become an integral part of the food processing industry. There are various methods of food preservation: drying, canning, freezing, food processing, etc. Food processing is one of the methods of food preservation which is the set of methods and techniques used to transform raw ingredients into food or to transform food into other forms for consumption by humans or animals either in the home or by the food processing industry. Canning is one of the various methods of food preservation in which the food is processed and then sealed in an airtight container. This process prevents microorganisms from entering and proliferating inside. Dehydration is the process of removing water or moisture from a food product. Food dehydration is safe because water is removed from the food. Freezing is also one of the most commonly used processes commercially and domestically for preserving a very wide range of food, including prepared food stuffs which would not have required freezing in their unprepared state. Benefits of food processing include toxin removal, preservation, easing marketing and distribution tasks, and increasing food consistency. In addition, it increases seasonal availability of many foods, enables transportation of delicate perishable foods across long distances, and makes many kinds of foods safe to eat by deactivating spoilage and pathogenic microorganisms. Nanotechnology exhibits great potential for the food industry. New methods for processing nanostructures are being developed, having novel properties that were not previously possible. As such, due to the recent upgradation of preservation techniques, the preservation industry is also growing almost at the same rate as the food industry, which is about 10 to 12% per year. The purpose of this book is to present the elements of the technology of food preservation. It deals with the products prepared from various fruits and vegetables commercially. Relevant information on enzymes, colours, additives, flavours, adulteration, etc. has been given. This book also contains photographs of equipments and machineries used in food preservation. This book will be very useful for new entrepreneurs, food technologists, industrialists, libraries, etc.      Handbook on Fruits, Vegetables & Food Processing with Canning & Preservation (3rd Edition) NPCS Board, 2012-02-09 Natural foods such as fruits and vegetables are among the most important foods of mankind as they are not only nutritive but are also indispensable for the maintenance of the health. India is the second largest producer of fruits and vegetables in the world. Fertile soils, a dry climate, clean water, and abundant sunlight help the hard-working farmers to produce a bountiful harvest. Although there are many similarities between fruits and vegetables, there is one important difference that affects the way that these two types of crop are processed: like fruits, are more acidic than vegetables. Food processing is the set of methods and techniques used to transform raw ingredients into food or to transform food into other forms for consumption. Food processing typically takes clean harvested crops or butchered animal products and uses these to produce attractive, marketable and often long shelf life food products. Canning is a method of preserving food in which the food is processed and sealed in an airtight container. Food preservation is the process of treating and handling food to stop or greatly slow down spoilage, loss of quality, edibility or nutritive value caused

or accelerated by micro organisms One of the oldest methods of food preservation is by drying which reduces water activity sufficiently to prevent or delay bacterial growth Drying also reduces weight making food more portable Freezing is also one of the most commonly used processes commercially and domestically for preserving a very wide range of food including prepared food stuffs which would not have required freezing in their unprepared state Fruits and vegetable processing in India is almost equally divided between the organized and unorganized sector with the organized sector holding 48% of the share The present book covers the processing techniques of various types of fruits vegetables and other food products This book also contains photographs of equipments and machineries used in fruits vegetables and food processing along with canning and preservation This book is an invaluable resource for new entrepreneurs food technologists industrialists etc
