Schintler, 2006-03-30 One aspect of the new economy is a transition to a networked society and the emergence of a highly interconnected interdependent and complex system of networks to move people goods and information An example of this is the increasing reliance of networked systems e.g. air transportation networks electric power grid maritime transport etc. on telecommunications and information infrastructure Many of the networks that evolved today have an added complexity in that they have both a spatial structure i.e. they are located in physical space but also an additional spatial dimension brought on largely by their dependence on information technology They are also often just one component of a larger system of geographically integrated and overlapping networks operating at different spatial levels An understanding of these complexities is imperative for the design of plans and policies that can be used to optimize the efficiency performance and safety of transportation telecommunications and other networked systems In one sense technological advances along with economic forces that encourage the clustering of activities in space to reduce transaction costs have led to more efficient

network structures At the same time the very properties that make these networks more efficient have also put them at a greater risk for becoming disconnected or significantly disrupted when super connected nodes are removed either intentionally or through a targeted attack
