

net value under all weather conditions will be used for each crop (weighing the net values under the various scenarios by the frequencies in the above table).

(g) Modify the linear programming model formulated in part (b) to fit this new approach.

(h) Repeat part (c) for this modified model.

(i) Use a shadow price obtained in part (h) to analyze whether it would be worthwhile for the family to obtain a bank loan with a 10 percent interest rate to purchase more livestock now beyond what can be obtained with the \$20,000 investment fund.

(j) For each of the three crops, use the post-optimality analysis information obtained in part (h) to identify how much latitude for error is available in estimating the net value per acre planted for that crop without changing the optimal solution.

Which two net values need to be estimated most carefully?

If both estimates are incorrect simultaneously, how close do the estimates need to be to guarantee that the optimal solution will not change?

The application of excess amount of inorganic fertilizer to increase the crop production may also boost the emissions of GHGs from agricultural fields.
