Abstract: Fish has historically played an important role in food security in many countries and contributes to do so in globally, providing 15-20 percent of animal protein intake. Fish farming has been practiced in different parts of the world like Europe. At present, the country Ethiopia has an estimated annual total exploitable fish potential of 51,481 tons, which can meet only 79 percent of the current actual demand, 55 percent of the projected demand in 2010 and 44 percent of the projected demand in 2015, based solely on population size. Lake Tana, Ashenge, Hayk, Koka, Zway, Langano, Awassa, Abaya and Chamo are among the Potential fish rich lakes found in Ethiopia. The main commercial species contributing to the total landing are *Oreochromis niloticus*, *Labeo* spp., *Clarias gariepinus*, *Burbus* species and *Lates niloticus*. Fish is highly nutritious, so even small quantities can improve people's diets. Several reasons like environmental degradation, poor fisheries development, increased illegal fisheries, traditional fishing system and climatic change attributed to the low production in the country.

Key words: Ethiopia - Fish - Production challenge

INTRODUCTION

Fish farming has been practiced in different parts of the world like Europe, Canada, East Asia, China, Africa and developing countries like Nigeria [1]. It has been in practice since the ancient civilization of Egypt and China. More than 120 million people throughout the world are estimated to depend on fish for all or part of their income. Conservation of communities implies knowledge of the number and distribution of species of any particular area. As habitat degradation continues on a global scale, maintenance of species richness has become a central issue of conservation biology [2].

It is estimated that the inland fisheries of Africa produce 2.1 million tons of fish, which represents 24% of the total global production from inland waters [3]. According to Food and agricultural organization [4] developing countries accounted for 49 percent of world exports by value and 59 percent by volume in 2006. With growing trade in fish products, there is growing concern about the possible effects on developing country consumption and nutrition [4].

Ethiopia is the largest livestock populations in the Africa. The livestock sector accounts for over 26 percent of agricultural GDP (2009/10) and 8 percent of export earnings (2010) and can produce over 51,500 tons of fish per annum. However, their exploitation and consequently their contributions to food security and growth in the country are minimal despite the technologies capable of resolving the problems of livestock and fisheries production [5].

At present, the country Ethiopia has an estimated annual total exploitable fish potential of 51,481 tons, which can meet only 79 percent of the current actual demand, 55 percent of the projected demand in 2010 and 44 percent of the projected demand in 2015, based solely on population size [6]. Fish is highly nutritious, so even small quantities can improve people's diets. Fish provides about 20 percent of animal protein intake in developing countries and this can reach 90 percent in Small Island Developing States (SIDS) or coastal areas. Fisheries can also contribute indirectly to food security by providing revenue for food-deficient countries to purchase food. Fish exports from low-income, food-deficient countries are equivalent to 50 percent of the cost of their food imports [7].

Fish Production Constraints In Ethiopia A Review:

Review of the Fisheries Resources of the Red Sea and Gulf of Aden M. J. Sanders, G. R. Morgan, 1989-01-01 The ten countries which border the Red Sea and Gulf of Aden depend to varying degrees on the area for their fish supplies with some countries such as South Yemen being totally dependent on the fish resources while to others such as Israel and Jordan the area is of minor importance Catches of all fish species have been increasing slowly in recent years and in 1986 totalled 60 9 thousand tons from the Red Sea and 99 4 thousand tons from the Gulf of Aden After reviewing the resource assessment and survey work which has been carried out in the area it was concluded that further increases in landings could be achieved on a sustainable basis However such increases will come from the development of new fisheries and the expansion of the areas presently Fished rather than from traditional fisheries which are in general fully exploited Utilization and marketing problems particularly with small pelagic and mesopelagic species however need to be addressed for the full potential of the area to be realized *Report of the Workshop on Climate Proofing Aquaculture in sub-Saharan Africa: Review of Policies and Production Systems for Climate Change Resiliency* Food and Agriculture Organization of the United Nations, 2018-11-14 Given aquaculture's growth in sub Saharan Africa this report sets out its current status and measures employed to adapt to climate change It includes a vulnerability assessment meteorological aquaculture and socioeconomic variables and a policy review *Commercial Fisheries Review* ,1968 **Fish Production in Irrigation Canals** Theresa A.
