Horstemeyer,Raj K. Prabhu,2021-10-27 Multiscale Biomechanical Modeling of the Brain discusses the constitutive modeling of the brain at various length scales nanoscale microscale mesoscale macroscale and structural scale In each scale the book describes the state of the experimental and computational tools used to quantify critical deformational information at each length scale Then at the structural scale several user based constitutive material models are presented along with real world boundary value problems Lastly design and optimization concepts are presented for use in occupant centric design frameworks This book is useful for both academia and industry applications that cover basic science aspects or applied research in head and brain protection The multiscale approach to this topic is unique and not found in other books It includes meticulously selected materials that aim to connect the mechanistic analysis of the brain tissue at size scales ranging from subcellular to organ levels Presents concepts in a theoretical and thermodynamic framework for each length scale Teaches readers not only how to use an existing multiscale model for each brain but also how to develop a new multiscale model Takes an integrated experimental computational approach and gives structured multiscale coverage of the problems **Official Gazette of the United States Patent Office** United States. Pavli, 1969 [Investigation Into the Adaptation of a Steam Injector for Use on a Liquid Rocket Engine](#) Charles Brian McFarland, 2000-03-01 This thesis investigated the properties of a steam injector to see if the concept might be suitable for use on a liquid rocket engine A steam injector is a device developed in the 1850 s to inject feedwater into the boiler on a steam locomotive without any moving parts The injectors uses a small portion of the steam generated in the boiler to increase the pressure of the feedwater to a level high than the pressure in the boiler Previous experiments claim that condensation of steam to water was necessary for an injector to work This experiment tested injection without condensation using one of AFIT s wind tunnels Compressed air was used to simulate steam and liquid ethanol was used in place of water Pressure measurements were taken at points along the tunnel to determine the performance of the tunnel Results show that this type of injection produces a small pressure rise compared to tests without liquid injection However the exit pressure is still lower than the initial pressure Further testing is recommended to analyze various parameters such as high temperature flows and injector size
