threats from the unknown Even if the bottom line defense technologies such as encrypted verification are adopted the security of hardware software products cannot be quantitatively designed verified or measured Due to the loose coupling relationship and border defense modes between the defender and the protected target there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside no matter how augmented or accumulated protective measures are adopted Therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective This book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing COTS and non trustworthy software hardware sources It has been proved that this revolutionary enabling technology has endowed software hardware products in IT ICT CPS with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes This book is designed for educators theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users Postgraduates in IT ICT CPS ICS will discover that as long as the law of structure determines the nature and architecture determines the security is properly used the problem of software hardware design defects or malicious code embedding will become the swelling of Achilles in the process of informationization and will no longer haunt Pandora s box in cyberspace Security and opening up advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem Windows Home zu Pro aufrüsten
