Focus On Life Science:

Business Modeling for Life Science and Biotech Companies Alberto Onetti, Antonella Zucchella, 2014-03-21 Most books on the biotechnology industry focus on scientific and technological challenges ignoring the entrepreneurial and managerial complexities faced by bio entrepreneurs. The Business Models for Life Science Firms aims to fill this gap by offering managers in this rapid growth industry the tools needed to design and implement an effective business model customized for the unique needs of research intensive organizations. Onetti and Zucchella begin by unpacking the often used business model term, examining key elements of business model conceptualization and offering a three tier approach with a clear separation between the business model and strategy focus, exploring the different activities carried out by the organization, locus evaluating where organizational activities are centered and modus, testing the execution of the organization's activities. The business model thus defines the unique way in which a company delivers on its promise to its customers. The theory and applications adopt a global approach offering business cases from a variety of biotech companies around the world. *Life Sciences Accomplishments*, 1986. Life Science Management Avo Schönbohm, Hans Henning von Horsten, Philipp Plugmann, 2022-07-14 The COVID 19 pandemic has reminded us of how important the life science industry is and compels us to find efficient management methods specific to the industry. Pharmaceuticals, drug and vaccine development labs, R D labs, medical instrumentation and tech companies, hygiene supply companies, medical distribution chains all form an integral part of this industry. At the interface of scientific research, technology innovation and management and embedded in regulatory and legal frameworks, life science management is still an under researched field of practice and science. This edited volume addresses this research gap and offers a wide range of practical and theoretical contributions that provide insights into one of the most exciting industries. The book is primarily directed at practitioners and decision makers in the life science industry. Students and professionals of life science management at all levels as well as policy makers will find valuable insights and inspiration for their daily work and career development. **Physical Sciences and Engineering Advances in Life Sciences and Oncology** Paul Janmey, Daniel Fletcher, Sharon Gerecht, Ross Levine, Parag Mallick, Owen McCarty, Lance Munn, Cynthia Reinhart-King, 2015-11-19 This book presents an Assessment of Physical Sciences and Engineering Advances in Life Sciences and Oncology APHELION by a panel of experts. It covers the status and trends of applying physical sciences and engineering principles to oncology research in leading laboratories and organizations in Europe and Asia. The book elaborates on the six topics identified by the panel that have the greatest potential to advance understanding and treatment of cancer, each covered by a chapter in the book. The study was sponsored by the National Cancer Institute (NCI) at the National Institute of Health (NIH), the National Science Foundation (NSF) and the National Institute of Biomedical Imaging and Bioengineering at the NIH in the US under a cooperative agreement with the World Technology Evaluation Center (WTEC) na, **Sif Biology Nl Tb**, 2007. **Life Science Careers** Jasna Markovac, Kim E. Barrett, Howard Garrison, 2024-05-09

This book is written for the many Life Science PhD students who may pursue careers outside of academic research. Even though the biggest portion of students will ultimately pursue other paths, university education trains them mostly for the academic track. Students often miss information, resources, contacts, or opportunities to explore other options. In response, the editors assembled a diverse group of authors from all fields related to Life Science research. The chapters offer a peek behind the curtain of each industry and offer guidance on how to move towards such roles. Through a high level of uniformity, students will get a plethora of career stories, each providing job opportunities, job descriptions, resources, and useful contact information. The purpose of this volume is to illustrate the many excellent opportunities that are available to life science PhDs, which will still allow them to make significant contributions to science.

Undergraduate Mathematics for the Life Sciences Glenn Ledder, Jenna P. Carpenter, Timothy D. Comar, 2013. There is a gap between the extensive mathematics background that is beneficial to biologists and the minimal mathematics background biology students acquire in their courses. The result is an undergraduate education in biology with very little quantitative content. New mathematics courses must be devised with the needs of biology students in mind. In this volume, authors from a variety of institutions address some of the problems involved in reforming mathematics curricula for biology students. The problems are sorted into three themes: Models, Processes, and Directions. It is difficult for mathematicians to generate curriculum ideas for the training of biologists, so a number of the curriculum models that have been introduced at various institutions comprise the Models section. Processes deals with taking that great course and making sure it is institutionalized in both the biology department as a requirement and in the mathematics department as a course that will live on even if the creator of the course is no longer on the faculty. Directions looks to the future with each paper laying out a case for pedagogical developments that the authors would like to see.

The Smartest Places on Earth Antoine van Agtmael, Fred Bakker, 2016-03-29. The remarkable story of how rustbelt cities such as Akron and Albany in the United States and Eindhoven in Europe are becoming the unlikely hotspots of global innovation, where sharing brainpower and making things smarter, not cheaper, is creating a new economy that is turning globalization on its head. Antoine van Agtmael and Fred Bakker counter recent conventional wisdom that the American and northern European economies have lost their initiative in innovation and their competitive edge by focusing on an unexpected and hopeful trend: the emerging sources of economic strength coming from areas once known as rustbelts that had been written off as yesterday's story. In these communities, a combination of forces—visionary thinkers, local universities, regional government initiatives, start-ups, and big corporations—have created brainbelts. Based on trust, a collaborative style of working, and freedom of thinking prevalent in America and Europe, these brainbelts are producing smart products that are transforming industries by integrating IT, sensors, big data, new materials, new discoveries, and automation. From polymers to medical devices, the brainbelts have turned the tide from cheap outsourced production to making things smart right in our own backyard. The next emerging market may in fact be the West.

Discovery-Based Learning in the Life Sciences Kathleen M. Susman,2015-06-29 For nearly a decade scientists educators and policy makers have issued a call to college biology professors to transform undergraduate life sciences education As a gateway science for many undergraduate students biology courses are crucial to addressing many of the challenges we face such as climate change sustainable food supply and fresh water and emerging public health issues While canned laboratories and cook book approaches to college science education do teach students to operate equipment make accurate measurements and work well with numbers they do not teach students how to take a scientific approach to an area of interest about the natural world Science is more than just techniques measurements and facts science is critical thinking and interpretation which are essential to scientific research Discovery Based Learning in the Life Sciences presents a different way of organizing and developing biology teaching laboratories to promote both deep learning and understanding of core concepts while still teaching the creative process of science In eight chapters the text guides undergraduate instructors in creating their own discovery based experiments The first chapter introduces the text delving into the necessity of science education reform The chapters that follow address pedagogical goals and desired outcomes incorporating discovery based laboratory experiences realistic constraints on such lab experiments model scenarios and alternate ways to enhance student understanding The book concludes with a reflection on four imperatives in life science research climate food energy and health and how we can use these laboratory experiments to address them Discovery Based Learning in the Life Sciences is an invaluable guide for undergraduate instructors in the life sciences aiming to revamp their curriculum inspire their students and prepare them for careers as educated global citizens
