

## CHAPTER 1

1.1 We will illustrate two different methods for solving this problem: (1) separation of variables, and (2) Laplace transform.

$$\frac{dv}{dt} = g - \frac{c}{m} v$$

Separation of variables: Separation of variables gives

$$\int \frac{1}{g - \frac{c}{m} v} dv = \int dt$$

The integrals can be evaluated as

$$= -\frac{\ln\left(g - \frac{c}{m} v\right)}{c/m} = t + C$$

where  $C$  = a constant of integration, which can be evaluated by applying the initial condition to yield

$$C = -\frac{\ln\left(g - \frac{c}{m} v(0)\right)}{c/m}$$

which can be substituted back into the solution

$$= -\frac{\ln\left(g - \frac{c}{m} v\right)}{c/m} = t - \frac{\ln\left(g - \frac{c}{m} v(0)\right)}{c/m}$$

This result can be rearranged algebraically to solve for  $v$ ,

$$v = v(0)e^{-c(t-t_0)/m} + \frac{mg}{c}\left(1 - e^{-c(t-t_0)/m}\right)$$

where the first part is the general solution and the second part is the particular solution for the constant forcing function due to gravity. For the case where,  $v(0) = 0$ , the solution reduces to Eq. (1.10)

$$v = \frac{mg}{c}\left(1 - e^{-c(t-t_0)/m}\right)$$

Laplace transform solution: An alternative solution is provided by applying Laplace's transform to the differential equation to give

$$sV(s) - v(0) = \frac{g}{s} - \frac{c}{m} V(s)$$

Solve algebraically for the transformed velocity

Ortega, 2013-06-29 Although the origins of parallel computing go back to the last century it was only in the 1970s that parallel and vector computers became available to the scientific community The first of these machines the 64 processor Illiac IV and the vector computers built by Texas Instruments Control Data Corporation and then Cray Research Corporation had a somewhat limited impact They were few in number and available mostly to workers in a few government laboratories By now however the trickle has become a flood There are over 200 large scale vector computers now installed not only in government laboratories but also in universities and in an increasing diversity of industries Moreover the National Science Foundation's Super computing Centers have made large vector computers widely available to the academic community In addition smaller very cost effective vector computers are being manufactured by a number of companies Parallelism in computers has also progressed rapidly The largest super computers now consist of several vector processors working in parallel Although the number of processors in such machines is still relatively small up to 8 it is expected that an increasing number of processors will be added in the near future to a total of 16 or 32 Moreover there are a myriad of research projects to build machines with hundreds thousands or even more processors Indeed several companies are now selling parallel machines some with as many as hundreds or even tens of thousands of processors      **The Publishers' Trade List Annual**, 1985      **Numerical**
