Chapter 1

Problems

1. (a) By the generalized basic principle of counting there are

$$26 \cdot 26 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 = 67,600,000$$

(b) $26 \cdot 25 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6 = 19,656,000$

2. $6^5 = 1296$

3. An assignment is a sequence i_1, \dots, i_{20} where i_j is the job to which person j is assigned. Since only one person can be assigned to a job, it follows that the sequence is a permutation of the numbers $1, \dots, 20$ and so there are $20!$ different possible assignments.

4. There are $4!$ possible arrangements. By assigning instruments to Jay, Jack, John and Jim, in that order, we see by the generalized basic principle that there are $2 \cdot 1 \cdot 2 \cdot 1 = 4$ possibilities.

5. There were $8 \cdot 2 \cdot 9 = 144$ possible codes. There were $1 \cdot 2 \cdot 9 = 18$ that started with a 4.

6. Each kitten can be identified by a code number i, j, k, l where each of i, j, k, l is any of the numbers from 1 to 7. The number i represents which wife is carrying the kitten, j then represents which of that wife's 7 sacks contain the kitten, k represents which of the 7 cats in sack j of wife i is the mother of the kitten, and l represents the number of the kitten of cat k in sack j of wife i . By the generalized principle there are thus $7 \cdot 7 \cdot 7 \cdot 7 = 2401$ kittens.

7. (a) $6! = 720$
(b) $2 \cdot 3! \cdot 3! = 72$
(c) $4!3! = 144$
(d) $6 \cdot 3 \cdot 2 \cdot 2 \cdot 1 \cdot 1 = 72$

8. (a) $\frac{5!}{7!} = 120$
(b) $\frac{2!2!}{2!2!} = 1260$
(c) $\frac{11!}{4!4!2!} = 34,650$
(d) $\frac{7!}{2!2!} = 1260$

9. $\frac{(12)!}{6!4!} = 27,720$

A First Course in the Design of

Experiments John H. Skillings, 2018-05-08 Most texts on experimental design fall into one of two distinct categories There are theoretical works with few applications and minimal discussion on design and there are methods books with limited or no discussion of the underlying theory Furthermore most of these tend to either treat the analysis of each design separately with little attempt to unify procedures or they will integrate the analysis for the designs into one general technique A First Course in the Design of Experiments A Linear Models Approach stands apart It presents theory and methods emphasizes both the design selection for an experiment and the analysis of data and integrates the analysis for the various designs with the general theory for linear models The authors begin with a general introduction then lead students through the theoretical results the various design models and the analytical concepts that will enable them to analyze virtually any design Rife with examples and exercises the text also encourages using computers to analyze data The authors use the SAS software package throughout the book but also demonstrate how any regression program can be used for analysis With its balanced presentation of theory methods and applications and its highly readable style A First Course in the Design of Experiments proves ideal as a text for a beginning graduate or upper level undergraduate course in the design and analysis of experiments
