Chapter 13 Lab **From DNA to Protein Synthesis**

Problem

What are the steps involved in making a protein?

Introduction

Before a protein can be built, the biochemical blueprints for its construction must be packaged and transferred out of the DNA “library.” First, the specific sequence of DNA that codes for the protein is transcribed into a complementary strand of mRNA. In eukaryotic cells, the mRNA then leaves the nucleus and enters the cytoplasm. In all cells, the mRNA molecule attaches to a ribosome, where tRNA anticodons translate the mRNA into amino acids. The completed amino acid chain, or polypeptide, then folds into its final shape as a protein.

In this lab, you will model transcription of DNA and translation of mRNA while you decode secret messages.

Skills Focus

Use Models, Sequence

Pre-Lab Questions

1. **Sequence** Describe briefly the process you will use to decode the messages.

2. **Compare and Contrast** What role do stop codons play in protein synthesis? What are they used for in the coded messages?

3. **Predict** Which six letters will not appear in the coded messages? Give a reason for your answer.

Leading-edge Messenger RNA Research Communications Martin H. Ostrovskiy, 2007 mRNA messenger RNA is the mediating template between DNA and proteins The information from a particular gene is transferred from a strand of DNA by the construction of a complementary strand of RNA through a process known as transcription Next three nucleotide segments of RNA called tRNA transfer RNA which are attached to specific amino acids match up with the template strand of mRNA to order the amino acids correctly These amino acids are then bonded together to form a protein This process called translation occurs in the ribosome which is composed of proteins and the third kind of RNA rRNA ribosomal RNA This important book presents research from around the globe on this very active field of scientific investigation
