Probability and Statistical Physics in Two and More Dimensions Clay Mathematics Institute. Summer School, 2012 This volume is a collection of lecture notes for six of the ten courses given in Buzios Brazil by prominent probabilists at the 2010 Clay Mathematics Institute Summer School Probability and Statistical Physics in Two and More Dimensions and at the XIV Brazilian School of Probability In the past ten to fifteen years various areas of probability theory related to statistical physics disordered systems and combinatorics have undergone intensive development A number of these developments deal with two dimensional random structures at their critical points and provide new tools and ways of coping with at least some of the limitations of Conformal Field Theory that had been so successfully developed in the theoretical physics community to understand phase transitions of two dimensional systems Included in this selection are detailed accounts of all three foundational courses presented at the Clay school Schramm Loewner Evolution and other Conformally Invariant Objects Noise Sensitivity and Percolation Scaling Limits of Random Trees and Planar Maps together with contributions on Fractal and Multifractal properties of SLE and Conformal Invariance of Lattice Models Finally the volume concludes with extended articles based on the courses on Random Polymers and Self Avoiding Walks given at the Brazilian School of Probability during the final week of the school Together these notes provide a panoramic state of the art view of probability theory areas related to statistical physics disordered systems and combinatorics Like the lectures themselves they are oriented towards advanced students and postdocs but experts should also find much of interest

Singular Perturbations and Boundary Layers Gung-Min Gie, Makram Hamouda, Chang-Yeol Jung, Roger M. Temam, 2018-11-21 Singular perturbations occur when a small coefficient affects the highest order derivatives in a system of partial differential equations. From the physical point of view singular perturbations generate in the system under consideration thin layers located often but not always at the boundary of the domains that are called boundary layers or internal layers if the layer is located inside the domain. Important physical phenomena occur in boundary layers. The most common boundary layers appear in fluid mechanics e.g. the flow of air around an airfoil or a whole airplane or the flow of air around a car. Also in many instances in geophysical fluid mechanics like the interface of air and earth or air and ocean. This self contained monograph is devoted to the study of certain classes of singular perturbation problems mostly related to thermic fluid mechanics and optics and where mostly elliptic or parabolic equations in a bounded domain are considered. This book is a fairly unique resource regarding the rigorous mathematical treatment of boundary layer problems. The explicit methodology developed in this book extends in many different directions the concept of correctors initially introduced by J. L. Lions and in particular the lower and higher order error estimates of asymptotic expansions are obtained in the setting of functional analysis. The review of differential geometry and treatment of boundary layers in a curved domain is an additional strength of this book. In the context of fluid mechanics the outstanding open problem of the vanishing viscosity limit of the Navier Stokes equations is investigated in this book and solved for a number of particular but physically relevant cases. This book will serve as a unique resource for those studying singular perturbations and boundary layer problems at the advanced graduate level in mathematics or applied mathematics and may be useful for practitioners in other related fields in science and engineering such as aerodynamics fluid mechanics geophysical fluid mechanics acoustics and optics.

Building Cyber Resilience Against Hybrid Threats M. Bogdanoski, 2022-08-31 Today's security environment is increasingly complex and unpredictable with cyber attacks and hybrid warfare blurring the lines between conventional and unconventional forms of conflict threats to energy security such as climate change and natural disasters and disruptive technologies like AI and quantum computing. The challenge of adapting and responding to these threats calls for cooperation and novel ways of thinking. This book presents 11 edited contributions from the NATO Advanced Training Course ATC Strengthening SEE Resilient Cyber Defense against Hybrid Threats STRENGTH held as an online event from 26 September 02 October 2021. The ATC brought together more than 60 military and civilian expert participants with 19 renowned professors experts and practitioners from 14 NATO Member and Partner countries as speakers and lecturers. The ATC aimed to raise awareness about the Alliance and the South Eastern Europe SEE evolving complex threat environment and establish the foundation for a long term multidisciplinary collaboration among defense and security experts and academia with the event serving as a first step in the creation of a SEE Network of

defense security and academic experts which can work across borders linking state of the art of research and practice to build resilience against hybrid warfare capabilities Participants learned how state and non state actors acquire hybrid threats via cyberspace to achieve their strategic ends and took part in working groups moderated by invited speakers lecturers engaging in the productive discussion of questions related to the course topic The event concluded with briefings presenting relevant case studies and lessons learned
