Location-Based Services Axel Küpper, 2005-10-31 Location based Services LBSs are mobile services for providing information that has been created compiled selected or filtered under consideration of the users current locations or those of other persons or mobile devices Typical examples are restaurant finders buddy trackers navigation services or applications in the areas of mobile marketing and mobile gaming The attractiveness of LBSs is due to the fact that users are not required to enter location information manually but are automatically pinpointed and tracked This book explains the fundamentals and operation of LBSs and gives a thorough introduction to the key technologies and organizational procedures offering comprehensive coverage of positioning methods location protocols and service platforms alongside an overview of interfaces languages APIs and middleware with examples demonstrating their usage Explanation and comparison of all protocols and architectures for location services In depth coverage of satellite cellular and local positioning All embracing introduction to 3GPP positioning methods such as Cell Id E OTD U TdoA OTDoA IPDL and Assisted GPS Explains the operation of enhanced emergency services such as E 911 Identifies unsolved research issues and challenges in the area of LBSs This comprehensive guide will

be invaluable to undergraduate and postgraduate students and lecturers in the area of telecommunications. It will also be a useful resource to developers and researchers seeking to expand their knowledge in this field. Optimizing Wireless Communication Systems Francisco Rodrigo Porto Cavalcanti, Sören Andersson, 2009-07-31 In June 2000 GTEL Wireless Telecommunications Research Group at the Federal University of Ceara was founded by Professor Rodrigo Cavalcanti and his colleagues with the mission of developing wireless communications technology and impact the development of the Brazilian telecommunications sector. From the start this research effort has been supported by Ericsson Research providing a dynamic environment where academia and industry together can address timely and relevant research challenges. This book summarizes much of the research output that has resulted from GTEL's efforts. It provides a comprehensive treatment of the physical and multiple access layers in mobile communication systems describing different generations of systems but with a focus on 3G systems. The team of Professor Cavalcanti has contributed scientifically to the development of this field and built up an impressive expertise. In the chapters that follow they share their views and knowledge on the underlying principles and technical trade offs when designing the air interface of 3G systems. The complexity of 3G systems and the interaction between the physical and multiple access layers present a tremendous challenge when modeling, designing and analyzing the mobile communication system. Herein the authors tackle this problem in an impressive manner. Their work is very much in line with the developments in 3GPP providing a deeper understanding of the evolution of 3G and also future enhancements.

Wireless Communications Savo G. Glisic, Pentti A. Leppänen, 2013-03-14 In Time Division Multiple Access (TDMA) within a given time frame a particular user is allowed to transmit within a given time slot. This technique is used in most of the second generation digital mobile communication systems. In Europe the system is known as GSM, in USA as IS-136 and in Japan as JTTT. In Code Division Multiple Access (CDMA) every user is using a distinct code so that it can occupy the same frequency bandwidth at the same time with other users and still can be separated on the basis of low correlation between the codes. These systems like IS-95 in the USA are also developed and standardized within the second generation of the mobile communication systems. CDMA systems within a cellular network can provide higher capacity and for this reason they become more and more attractive. At this moment it seems that both TDMA and CDMA remain viable candidates for application in future systems. Wireless Communications: TDMA versus CDMA provides enough information for correct understanding of the arguments in favour of one or other multiple access technique. The final decision about which of the two techniques should be employed will depend not only on technical arguments but also on the amount of new investments needed and compatibility with previous systems and their infrastructures. Wireless Communications: TDMA versus CDMA comprises a collection of specially written contributions from the most prominent specialists in wireless communications in the world today and presents the major up to date issues in this field. The material is grouped into four chapters: Communication theory covering coding and modulation; Wireless communications; Antenna; Propagation and Advanced
