

ELECTRONIC COMPONENTS

CLASSIFICATION OF COMPONENTS

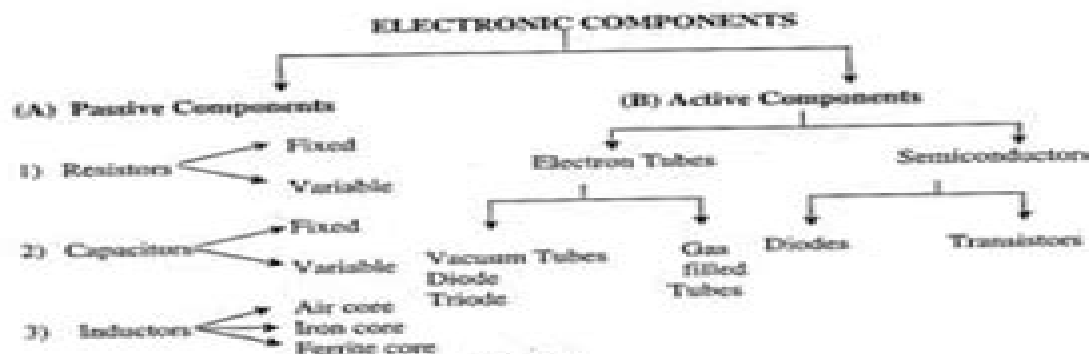

Fig. (4.1)

(a) Passive Components

Since this category belongs to inactive functions of the component, these components do not have capacity to amplify the voltage or to rectify supply therefore, they are called as "Passive components". Resistors, capacitors and Inductors are called as passive components.

(b) Active Components

Since these components are capable of performing active functions like amplification, rectification and switching, they are called as "active components".

(i) Electron tubes like Diode, triode and (ii) Semiconductor devices like diode, LED, Transistor etc. Electron tubes are rarely used because they are outdated.

RESISTORS

The value of resistance is measured in Ohm (Ω). Resistance is the opposition to the flow of electrons or simply opposition to the electric current. Resistance is required in electronic circuits to **limit the current, to drop the voltage and to divide the voltage**. In combination with capacitor, it is used as filter or it can be used to achieve a time delay.
