Rubber Seals for Fluid and Hydraulic Systems Chellappa Chandrasekaran, 2009-11-09 Rubber Seals for Fluid and Hydraulic Systems is a comprehensive guide to the manufacturing and applications of rubber seals with essential coverage for industry sectors including aviation oil drilling and the automotive industry Fluid leakage costs industry millions of dollars every year In addition to wasted money unattended leaks can result in downtime affect product quality pollute the environment and cause injury Successful sealing involves containment of fluid within a system while excluding the contaminants the resilience of rubber enables it to be used to achieve these two objectives and create a tight sealing effect A sound understanding of the complex factors involved in successful fluid sealing is essential for engineers who specify design operate and maintain machinery and mechanical equipment This book focuses on the characteristics of rubbers as seals their manufacturing procedures the implications of their physical and chemical characteristics for the sealing function in the fluid and hydraulic systems how rubbers seal and prevent leaks what properties are required for sealing function and how they change before and after installation The chapter on Manufacture of Seals and O Rings includes approximately 25 workable starting point formulations based on different rubbers with cure and property data of those formulations as guidelines for technologists and engineers Emphasis on important areas such as applications of rubber as fluid seals in the nuclear aviation oil drilling and automotive industries Includes a chapter on Rubber Expansion Joints as the function of such expansion joints as pipe connectors is indirectly linked with leakage and prevention of fluid flow through the pipes The chapter on Manufacture of Seals and O Rings includes approx 25 workable starting point formulations based on different rubbers with cure and property data of those formulations as guidelines for technologists and engineers

O-ring Installation for Underwater Components and Applications C. J. Sandwith, 1982 Gland Design, O-ring and Other Elastomeric Seals A-6C2 Seals Committee, 2005 This SAE Aerospace Standard AS provides standardized gland groove design criteria and

dimensions for elastomeric seal glands for static and dynamic applications The glands have been specifically designed for applications using SAE AS568 size O rings with related class 2 tolerances at pressures exceeding 1500 psi 10 342 kPa utilizing one or two anti extrusion backup rings and applications at pressures under 1500 psi 10 342 kPa without backup rings The glands have been sized to provide sufficient squeeze for effective sealing while at the same time limiting squeeze to allow satisfactory operation in dynamic applications While this specification covers the basic design criteria and recommendations for use with standard size O rings these glands are also suitable for use with other elastomeric and polytetrafluoroethylene PTFE based seals and packings Design Data for O-rings and Similar Elastic Seals Frank W.

Determination of Spring Modulus for Several Types of Elastomeric Materials (O-rings) and Establishment of an Open Database for Seals ,1995 Seals that provide the containment system interface between the packaging body and closure must function in high and low temperature environments under dynamic and static loading conditions and with different types of contained media It is one of the most critical elements in the container since the container fails to meet regulations if the seal does not function properly A research and testing program for seal materials was initiated at Sandia in 1988 with the goal of characterizing the behavior of seal materials commonly used in packages conditions as specified in the regulations NRC IOCFR Part 71 and American National Standards Institute ANSI 14.5 The performance of elastomeric seals in undeformed closures at both high and low temperatures has been investigated Bronowski 1995 Work has begun with this program to determine the response of elastomeric seals to fast acting dynamic deformations in the closure The response of elastomeric o ring seals during closure movements due to long term deformations has already been characterized What has not been well characterized are short term closure movements with durations of only a few milliseconds that result in the so called burp release Methods for generating this type of response in a repeatable manner had not been developed and standard leak detection equipment does not have a fast enough response time to measure these transient events One factor which affects the length of the burp is the ability of the o ring to quickly close the gap to prevent a significant leak The dynamic characteristics of the elastomeric o ring material including the dynamic spring modulus and internal damping are directly related to its ability to quickly close the gap A set of tests designed to determine the dynamic properties for various material types and durometers hardness of elastomers that were both lubricated and dry at ambient temperature were conducted
