Wind Load Calculations for PV Arrays Study Report Overview

This is about determining the loading and recommendations for the Solar America Research Center and Department of Energy Study Report, "Wind Load Calculations for PV Arrays."

Today's photovoltaic (PV) industry must rely on limited number of suggested recommendations of various building codes and standards to design PV mounting systems. Since no national wind-related loads, however, the safety and efficiency of structural assemblies for PV arrays are not adequately addressed and any codes or standards that result in a diversity of code interpretations leave different individuals and groups, often yielding different design loads for the same design specifications.

This report provides helpful calculations for determining wind loads on PV arrays based on ASCE Standard 7-02. The report focuses on application of PV arrays mounted parallel to the roof slope and relatively close (3 ft or less) to the roof surface. The report does not address other array configurations or building-mounted PV.

Key Findings

It is necessary to conduct independent and systematic methods to ensure that PV exposures will remain attached to structures during maximum events, and that the additional loads on load-carrying structural members during these events do not exceed their structural capacities of the building. ASCE Standard 7-02 is the standard for measuring wind loads on structures, but it does not provide sufficient guidance to the design professionals and/or officials to properly wind loads on PV assemblies.

This lack of guidance causes confusion for the PV industry. The resulting questions include structural analysis, structural members, and wind-resisting structural details, in addition, conservatively affect other construction code and array installation for a given wind direction due to the approved process for PV assemblies and compliance the meaning of code officials.

PV modules and array systems is unique design challenge as high wind regions. Currently, codes and standards will be updated to address the mounting of PV arrays to rooftops that otherwise prohibited or restrict their exposure in high wind regions.

In the meantime, this report provides design guidance including sample calculations for determining the wind loads on PV arrays based on the design wind loads of ASCE Standard 7-02.

Table A-10's Recommendations

1. Use the structural design of roof-mounted PV systems on the ASCE Standard 7-02 as follows:
2. Section 6.1.12.2: Wind conditions meeting system details to the recommended mounting points for designing the PV mounting systems with the PV module connected and parallel to the roof surface.

Best Practices for Commercial Roof-Mounted Photovoltaic System Installation Rosalie Wills, James A. Milke, Sara Royle, Kristin Steranka, 2015-05-22 This SpringerBrief presents information on a wide variety of hazards and the damage potential caused by installation of a photovoltaic PV system. The current installation practices for PV systems on roofs create electrical, fire, structural, and weather-related hazards that do not comply with current codes, standards, and guidance documents. Potential dangers include structural loading, wind loads, hail, snow, debris accumulation, seismic hazards, firefighting hazards, and electrical hazards. Despite the increased popularity of PV systems, after the environmental movement, research shows that the costs of installing PV systems outweigh the benefits. Hazards of PV systems on roofs have caused several incidents in the United States, the most notable in Bakersfield, California, and Mount Holly, North Carolina. Designed for fire engineers and professionals, *Best Practices for Commercial Roof Mounted Photovoltaic System Installation* offers recommendations to set up PV systems safely and sustainably.
