XAMPP: SSL Encrypt the Transmission of Passwords with https

[Rob](#) July 15th, 2007

This article is part of a series of articles about making [XAMPP](#) more secure. See the [overview page](#) for all the security measures.

If you don't have encryption enabled on a password protected folder, the password will be sent in cleartext — meaning that it can be seen by anyone using a network sniffer. It is a good idea to encrypt the transmission of these passwords. There are 2 steps to this process, first we need to create SSL certificates, and then we need to make sure that the password protected pages are only accessed with encryption. It's also a good idea to import your certificates into any browsers on all machines that you plan to use to access your server, otherwise you'll get a warning about an untrusted certificate authority.

Create SSL Certificate and Server Private Key

In order to enable the encryption of your password, you must create an SSL certificate (containing your public key) and a server private key. XAMPP provides a default certificate/key that can be used, but it is better to create a new one since the default key is available to anyone who downloads XAMPP. If someone knows your key, they can decrypt your packets.

XAMPP provides a batch file for creating a new certificate/key with random encryption keys. To execute this batch file, do the following:

1. Open a command window (Start->Run, type "cmd" and press "OK")
2. cd c:\xampp\apache
3. makecert

You will then see this:

```
C:\xampp\apache>newcert
Loading 'screen' into random state - done
Generating a 1024 bit RSA private key
.....++++++
.....++++++
writing new private key to 'privkey.pem'
Enter PEM pass phrase:
```

Enter in a pass phrase for decrypting your private server key, and press Enter. Write down this passphrase so you don't forget it. Now you will be asked to verify it:
