Innovations in H The Logics of Healthcare Paul Lillrank, 2018-01-03 Most of the current literature on healthcare operations management is focused on importing principles and methods from manufacturing The evidence of success is scattered and nowhere near what has been achieved in other industries This book develops the idea that the logic of production and production systems in healthcare is significantly different A line of thing that acknowledges the ingenious characteristics of health service production is developed This book builds on a managerial segmentation of healthcare based on fundamental demand supply constellations Demand can be classified with the variables urgency severity and randomness Supply is constrained by medical technology accuracy of diagnostics efficacy of therapies patient health behavior co creation of health and resource availability Out of this emerge seven demand supply based operational types DSO prevention emergencies one visit electives cure care and projects Each of these have distinct managerial characteristics such as time perspective level of co creation value proposition revenue structure productivity and other key performance indicators KPI The DSOs can be envisioned as platforms upon which clinical modules are attached For example any Emergency Department ED must be managed to deal with prioritization time windows agitated patients the necessity to save and stabilize and variability in demand Specific clinical assets and skill sets are required for say massive trauma strokes cardiac events or poisoning While representing different specialties of clinical medicine they when applied in the emergency context must conform to the demand supply based operating logic A basic assumption in this book is that the perceived complexity of healthcare arises from the conflicting demands of the DSO and the clinical realms The seven DSOs can neatly be juxtaposed on the much used Business Model Canvas BMC which postulates the business model elements as value proposition customer segments channels and relations key activities resources and partners the cost structure and the revenue model

Logistics management operationalised in a healthcare context Malin Wiger, 2018-05-14 Healthcare improvements is constantly relevant and an important topic Healthcare is frequently being called upon to be more cost efficient and still fulfil demands regarding waiting times quality and availability Experience from structural changes in other contexts gives reason to be positive about the potential for logistics improvements in the healthcare sector as well From a logistics perspective patients pass different care functions units organisations and health facilities It is assumed that logistics management knowledge applied in healthcare can lead to lower costs shorter waiting times better patient service shorter treatment times and increased capacity This dissertation therefore presents an exploration of how logistics management theories can be operationalised in a healthcare context to understand care chain effectiveness Theoretically the operationalisation is done by systems theory creating compatibility between logistics management theories and the healthcare context As a first step features for a logistics system forms features for achieving care chain effectiveness High care chain effectiveness is thus a desired condition and the care delivery system is the tool to achieve it As the final step in the operationalisation the features for care chain effectiveness are in turn used to analyse today's practices Empirically the research is based on qualitative data from a single case study with multiple units of analysis It includes four care units at one of Sweden's university hospitals where the data is gathered through interviews insight into management systems and document analysis One of the main results is the 21 areas identified for analysing today's practices by means of features for care chain effectiveness Another main result is the four important concepts revealed through the operationalisation Lead time the episode of care from order to delivery as the amount of time for patient cases between first contact with healthcare and the last Patient order fulfilment fulfilment of patients needs broken down into several smaller steps performed over time within different care units in one or several organisations consisting of five sub processes order handling diagnosis treatment follow up and discharge True demand patients needs that is to be met and thus sets what care to deliver i.e. the production plan and the subordinate resource plan System boundaries defines which care units to include when focusing on the care delivery system's performance as a whole and should be more important than the performance and productivity of each individual care unit A number of direct suggestions for care chain improvement can also be found in the concluding remarks for example that objectives linked to economic influx or penalty narrow the system and that lead time data on an aggregated level is needed to cover episodes of care The theoretical contribution of the dissertation is to the field of logistics management through the methodological development of using these theories in a new context The managerial contribution is to healthcare managers through providing opportunities to improve care chains primarily by means of a greater
