High-Throughput Analysis Radislav A. Potyrailo, Eric J. Amis, 2012-12-06 This book edited by Potyrailo and Amis addresses a new paradigm shifting approach in the search for new materials Combinatorial Materials Science One way to consider such an approach is to imagine an adventurous chef who decides to look for new entrees by cooking food ingredients in many pots using different combinations in every pot and boiling steaming or frying them in various ways Although most of the pots will not have the tastiest food ever devised some recipes will taste intriguing and some eventually will lead to a discovery of a new fascinating cuisine Of course having a skilled chef design the combinatorial formulation will certainly be helpful in ensuring a successful outcome Similar to food each engineering material is a complex product of its chemical composition structure and processing Generally each of these components matters change one and you get another material Most of these new materials will be less good than ones we use now since existing materials have been refined with the extensive work of scientists and engineers At the same time if one prepares diverse materials like our adventurous chef changing material composition processing conditions and time etc some of these materials will be superior to existing ones and a few might represent breakout technology

Energy Landscapes, Inherent Structures, and Condensed-Matter Phenomena Frank H. Stillinger, 2015-11-17 This book presents an authoritative and in depth treatment of potential energy landscape theory a powerful analytical approach to describing the atomic and molecular interactions in condensed matter phenomena Drawing on the latest developments in the computational modeling of many body systems Frank Stillinger applies this approach to a diverse range of substances and systems including crystals liquids glasses and

other amorphous solids polymers and solvent suspended biomolecules Stillinger focuses on the topography of the multidimensional potential energy hypersurface created when a large number of atoms or molecules simultaneously interact with one another He explains how the complex landscape topography separates uniquely into individual basins each containing a local potential energy minimum or inherent structure and he shows how to identify interbasin transition states saddle points that reside in shared basin boundaries Stillinger describes how inherent structures and their basins can be classified and enumerated by depth curvatures and other attributes and how those enumerations lead logically from vastly complicated multidimensional landscapes to properties observed in the real three dimensional world Essential for practitioners and students across a variety of fields the book illustrates how this approach applies equally to systems whose nuclear motions are intrinsically quantum mechanical or classical and provides novel strategies for numerical simulation computations directed toward diverse condensed matter systems
