**From Solid State Chemistry to Heterogeneous Catalysis** Svetlana Ivanova, José A. Odriozola, Luis F. Bobadilla, 2021-09-30 Heterogeneous catalysis is deeply founded on solid state chemistry but the relationship between the two often appears to be elusive in many cases It is generally difficult to relate the allusion of symmetry to the crystal structure and the defect chemistry or acid base properties to the surface reconstruction and extended defects that in most cases are the basis of physicochemical properties and solids applications This book provides insights into solid state chemistry in order to widen the vision of heterogeneous catalysis It covers a broad range of solid state related topics including symmetry and structure organization bonding and methods for structure elucidation as well as defects formation and their implications in heterogeneous catalysis

**The Periodic Table II** D. Michael P. Mingos,2020-02-05 As 2019 has been declared the International Year of the Periodic Table it is appropriate that Structure and Bonding marks this anniversary with two special volumes In 1869 Dmitri Ivanovitch Mendeleev first proposed his periodic table of the elements He is given the major credit for proposing the conceptual framework used by chemists to systematically inter relate the

chemical properties of the elements However the concept of periodicity evolved in distinct stages and was the culmination of work by other chemists over several decades For example Newland s Law of Octaves marked an important step in the evolution of the periodic system since it represented the first clear statement that the properties of the elements repeated after intervals of 8 Mendeleev s predictions demonstrated in an impressive manner how the periodic table could be used to predict the occurrence and properties of new elements Not all of his many predictions proved to be valid but the discovery of scandium gallium and germanium represented sufficient vindication of its utility and they cemented its enduring influence Mendeleev s periodic table was based on the atomic weights of the elements and it was another 50 years before Moseley established that it was the atomic number of the elements that was the fundamental parameter and this led to the prediction of further elements Some have suggested that the periodic table is one of the most fruitful ideas in modern science and that it is comparable to Darwin s theory of evolution by natural selection proposed at approximately the same time There is no doubt that the periodic table occupies a central position in chemistry In its modern form it is reproduced in most undergraduate inorganic textbooks and is present in almost every chemistry lecture room and classroom This second volume provides chemists with an overview of the important role played by the Periodic Table in advancing our knowledge of solid state and bioinorganic chemistry It also illustrates how it has been used to fine tune the properties of compounds which have found commercial applications in catalysis electronics ceramics and in medicinal chemistry

*Two-step MOVPE, in-situ etching and buried implantation: applications to the realization of GaAs laser diodes* Pietro della Casa, 2021-03-25 This work is about two step epitaxial growth using metalorganic vapor phase epitaxy MOVPE for the realization of edge emitting near infrared laser diodes The fabricated gallium arsenide based devices fall into two categories high power lasers watt range multimodal and tunable lasers milliwatt range monomodal Common to both cases is that surface contamination particularly that due to oxygen needs to be removed before regrowth Thus in situ etching with carbon tetrabromide CBr<sub>4</sub> is first studied The experimental results include kinetic data the effects of different etching conditions as well as substrate characteristics and the effectiveness in reducing surface contamination These investigations pave the way to devices based on 2 step epitaxy combined with in situ etching Correspondingly thermally tuned SG DBR lasers operating around 975 nm have been successfully realized obtaining a tuning range of 21 nm In addition the possibility of using electronic tuning in similar devices has been explored High power broad area lasers have also been realized using two step epitaxy combined with ex situ and in situ etching to create a buried shallow mesa containing the active zone This approach allows introducing lateral electrical and optical confinement and simultaneously non absorbing mirrors at the laser facets Additionally a different strategy to create a buried current aperture is presented which is based on ion implantation followed by epitaxial regrowth This enables to improve device performance and simultaneously introduce non absorbing mirrors at the facets with correspondingly increased reliability
