Charge-based CMOS Digital RF Transmitters Pedro Emiliano Paro Filho, Jan Craninckx, Piet Wambacq, Mark Ingels, 2016-09-27 This book introduces a completely novel architecture that can relax the trade off existing today between noise power and area consumption in a very suitable solution for advanced wireless communication systems Through the combination of charge domain operation with incremental signaling this architecture gives the best of both worlds providing the reduced area and high portability of digital intensive architectures with an improved out of band noise performance given by intrinsic noise filtering capabilities Readers will be

enabled to design higher performance radio front ends that consume less power and area especially with respect to the transmitter and power amplifier designs considered by many the battery killers on most mobile devices Model and Design of Improved Current Mode Logic Gates Kirti Gupta, Neeta Pandey, Maneesha Gupta, 2019-11-22 This book presents MOSFET based current mode logic CML topologies which increase the speed and lower the transistor count supply voltage and power consumption The improved topologies modify the conventional PDN load and the current source sections of the basic CML gates Electronic system implementation involves embedding digital and analog circuits on a single die shifting towards mixed mode circuit design The high resolution low power and low voltage analog circuits are combined with high frequency complex digital circuits and the conventional static CMOS logic generates large current spikes during the switching also referred to as digital switching noise which degrade the resolution of the sensitive analog circuits via supply line and substrate coupling This problem is exacerbated further with scaling down of CMOS technology due to higher integration levels and operating frequencies In the literature several methods are described to reduce the propagation of the digital switching noise However in high resolution applications these methods are not sufficient The conventional CMOS static logic is no longer an effective solution and therefore an alternative with reduced current spikes or that draws a constant supply current must be selected The current mode logic CML topology with its unique property of requiring constant supply current is a promising alternative to the conventional CMOS static logic **CMOS Low Noise Amplifiers for Single and Multiband Applications: A Comprehensive Design Approach** Norlaili Mohd Noh, Farshad Eshghabadi, Arjuna Marzuki, 2023-10-11 This book provides comprehensive knowledge aimed at practicing integrated circuit design engineer or researcher to learn and design a low noise amplifier LNA for single and multiband applications The content is structured in a way so that even a beginner can follow the design method easily This book features the following characteristics different types of LNA designs with key building blocks are discussed and detailed analysis is given for each LNA design which covers from the fundamental and principal knowledge to the justification of the design approach Detailed design approaches are using 180 nm and 130nm CMOS technologies purposely presented in this manner to give exposure to the design of LNA under different technologies The LNAs in this book are designed for GSM WCDMA and WLAN standards but the same method can be used for other frequencies of operation Comprehensive analyses on the extreme or corner condition effects are highlighted Besides detailed derivation of equations relating to the parameters of the LNA s performance metrics help LNA designers in understanding how the performance metrics of the LNA can be optimized to meet the desired specification Electromagnetic analyses using Sonnet an electromagnetic tool able to replace the conventional post layout simulation with resistance and capacitance parasitic extraction for more accurate frequency performance prediction are presented The electromagnetic method is proposed to be used in the LNA design as it can accurately predict the LNA s performance before tape out for first pass fabrication MATLAB codes are provided to generate important S parameters and noise figure values

for Optical Receivers Jafar Savoj,Behzad Razavi,2007-05-08 With the exponential growth of the number of Internet nodes the volume of the data transported on the backbone has increased with the same trend The load of the global Internet backbone will soon increase to tens of terabits per second This indicates that the backbone bandwidth requirements will increase by a factor of 50 to 100 every seven years Transportation of such high volumes of data requires suitable media with low loss and high bandwidth Among the available transmission media optical fibers achieve the best performance in terms of loss and bandwidth High speed data can be transported over hundreds of kilometers of single mode fiber without significant loss in signal integrity These fibers progressively benefit from reduction of cost and improvement of performance Meanwhile the electronic interfaces used in an optical network are not capable of exploiting the ultimate bandwidth of the fiber limiting the throughput of the network Different solutions at both the system and the circuit levels have been proposed to increase the data rate of the backbone System level solutions are based on the utilization of wave division multiplexing WDM using different colors of light to transmit several sequences simultaneously In parallel with that a great deal of effort has been put into increasing the operating rate of the electronic transceivers using highly developed fabrication processes and novel circuit techniques **MEMS-based Circuits and Systems for Wireless Communication** Christian C Enz,Andreas
