

An exploratory investigation of the factors affecting risk assessment of street crime place

SU YUQING

Purpose

The purpose of this study was to examine factors that affect risk assessment of place of occurrence of crimes.

We selected four locations in total from the area surrounding Ikebukuro station where a field survey was conducted, that is, two places where crime occurrence was recognized, and two places where crime occurrence was not recognized. Then, we conducted an experiment, wherein participants were presented with videos as a visual stimulus.

Method

Participant

There were a total of 194 T University students in Tokyo, 61 of them were men ($M = 19.79$, $SD = 0.77$), and 133 of them were females ($M = 19.93$, $SD = 0.73$).

Experiment procedure

Videos were presented one by one on the screen. During the experiment, the information about the location of the presentation video provided one map and did not provide any other information. Video presentation order was taken to be counterbalanced, ① without crime, ② with crime, ③ with crime, ④ without crime.

Consideration

The purpose of this study was to examine factors that affect risk assessment of place of occurrence of crimes. We conducted simultaneous multiple regression analysis, and found that the possibility of being criminally victimized, the evaluation of the possibility of being snatched or robbed, and the presence or absence of attention were found to have significant influences on risk assessment.

Result

Figure 1 path diagram

Figure 1 showed that the result of the variance analysis was significant at 1% at $F(11, 387) = 41.875$. And "the probability of being criminally victimized" ($\beta = 0.393$, $p < .01$), "the evaluation of the possibility of being snatched or robbed" ($\beta = 0.225$, $p < .01$) "the presence or absence of attention" ($\beta = 0.174$, $p < .01$) had a positive influence on risk assessment.

Eye Guidance in Reading and Scene Perception G. Underwood,1998-07-16 The distinguished contributors to this volume have been set the problem of describing how we know where to move our eyes There is a great deal of current interest in the use of eye movement recordings to investigate various mental processes The common theme is that variations in eye movements indicate variations in the processing of what is being perceived whether in reading driving or scene perception However a number of problems of interpretation are now emerging and this edited volume sets out to address these problems The book investigates controversies concerning the variations in eye movements associated with reading

ability concerning the extent to which text is used by the guidance mechanism while reading concerning the relationship between eye movements and the control of other body movements the relationship between what is inspected and what is perceived and concerning the role of visual control attention in the acquisition of complex perceptual motor skills in addition to the nature of the guidance mechanism itself The origins of the volume are in discussions held at a meeting of the European Society for Cognitive Psychology ESCOP that was held in Wurzburg in September 1996 The discussions concerned the landing effect in reading an effect that if substantiated would provide evidence of the use of parafoveal information in eye guidance and these discussions were explored in more detail at a small meeting in Chamonix in February 1997 Many of the contributors to this volume were present at the meeting but the arguments were not resolved in Chamonix either Other leaders in the field were invited to contribute to the discussion and this volume is the product The argument remains unresolved but the problem is certainly clearer
