

Background Information

Frogs belong to the class Amphibia. Amphibians have adaptations for living in terrestrial as well as aquatic environments. Frogs are among the most commonly studied organisms in biology. Although many differences exist between humans and frogs, the basic body plans are similar. Humans and frogs both belong to the phylum Chordata. By studying the anatomy of the frog, you will be better able to understand your own body.

In this investigation, you will examine the external features of a frog and identify parts of its external anatomy. In addition, you will dissect a preserved frog to observe its internal anatomy.

Problem

How is a frog structured for survival?

Materials (per group)

Preserved frog
Dissecting scissors
Hand lens or dissecting microscope

Dissecting tray
Forceps
Eye dropper

Dissecting pins
Probe

Procedure**Part A External Anatomy**

1. Place the preserved frog in your dissecting tray. Obtain all the dissecting equipment and place it at your work area.
2. Observe the frog. Feel the smooth and pliable skin. Note the coloration on all parts of the body.
3. The division of a frog's body includes the head, trunk, and limbs or legs as shown in Figure 1. All frogs lack necks and tails. Examine the front and hind limbs of the frog. Find the digits, which are finger like projections on the forelimbs and hind limbs. Locate the **hind limbs**, which are the longer and more muscular limbs of the frog. A hind limb consists of a thigh, shank, ankle, foot, and webbed toes. Locate the **forelimbs**, which are shorter than the hind limbs. A forelimb consists of an upper arm, wrist, hand, and fingers. On the male frog, find the male pad located on the innermost finger of the forelimb. The male pad is a dark swelling or enlargement used by a male to grasp a female during mating.

Biology/science Materials Carolina Biological Supply Company, 1991 **New Challenges and Perspectives in Conservation Breeding Programs** Eliana Pintus, José Luis Ros-Santaella, William Holt, Pierre Comizzoli, 2025-05-21 Conservation Breeding Programs CBPs remain essential tools to preserve animal biodiversity and save threatened species from extinction Despite the advances made during the last decades CBPs have been carried out only on a small number of species mostly mammals and birds There is therefore an urgent need to develop and complement in situ and ex situ strategies to also preserve other vertebrates like fish amphibians and reptiles in which the biodiversity loss because of climate change or other anthropogenic activities is even more dramatic One of the main factors that limits CBPs success is the lack of knowledge of the animal reproductive biology and behavior which is precisely known for instance in less than 4% of mammals the majority of which are terrestrial species Such knowledge is beneficial not only to enhance but also to control animal fertility that is especially warranted for the management of overabundant or invasive species which represent a further major threat for biodiversity The goal of this Research Topic is to bring together studies that deal with different aspects of animal reproduction both in captive and wild populations This includes both ex situ and in situ approaches such as the management of animal reproduction in captive populations and their reintroduction release into the wild Other approaches such as assisted reproductive technologies and biobanking greatly contribute to the success of conservation breeding This Research Topic also welcomes studies exploring the effects of biotic e g inbreeding diseases stress and abiotic e g anthropogenic activities housing and veterinary care factors on reproductive biology of all vertebrates classes with a special interest to fish amphibians and reptiles As a comprehensive knowledge of animal reproduction and behavior plays a key role for the development and success of breeding programs descriptive studies on reproductive anatomy and physiology of wild or captive species either endangered or overabundant are welcomed The Research Topic also accepts manuscripts that deal with ethical aspects of animal welfare in CBPs and population management of invasive or overabundant species

Petrovan,Viorel Dan Popescu,Thomas Edward S. Langton,Kimberly M. Andrews,2024-05-21 Roads may threaten the persistence of wildlife populations by acting as barriers to movement and or sources of increased mortality across the landscape Amphibians and reptiles have been identified as being particularly susceptible to negative road impacts Many species migrate annually among habitats to support basic life history requirements such as breeding development foraging

and overwintering For these species individuals may need to successfully cross roads multiple times each year for the population to persist Many are slow moving and freeze in the presence of danger making it almost impossible for them to avoid oncoming vehicles Although there are a plethora of road mortality location and count data the effects of road mortality on the long term viability of amphibian and reptile populations and metapopulations are mostly unknown due to a lack of information on their abundance vital rates behavior and spatial and temporal dynamics
