An Introduction To Multiagent Systems Second Edition:

An Introduction to MultiAgent Systems Michael Wooldridge, 2009-06-22 The study of multi agent systems MAS focuses on systems in which many intelligent agents interact with each other These agents are considered to be autonomous entities such as software programs or robots Their interactions can either be cooperative for example as in an ant colony or selfish as in a free market economy This book assumes only basic knowledge of algorithms and discrete maths both of which are taught as standard in the first or second year of computer science degree programmes A basic knowledge of artificial intelligence would be useful to help understand some of the issues but is not essential The book's main aims are To introduce the student to the concept of agents and multi agent systems and the main applications for which they are appropriate To introduce the main issues surrounding the design of intelligent agents To introduce the main issues surrounding the design of a multi agent society To introduce a number of typical applications for agent technology After reading the book the student should understand The notion of an agent how agents are distinct from other software paradigms e.g. objects and the characteristics of applications that lend themselves to agent oriented software The key issues associated with constructing agents capable of intelligent autonomous action and the main approaches taken to developing such agents The key issues in designing societies of agents that can effectively cooperate in order to solve problems including an understanding of the key types of multi agent interactions possible in such systems The main application areas of agent based systems

Efficient Resource Allocation for Automotive Active Vision Systems Stephan Matzka,2010-02-09 The main goal when operating a vehicle is to safely participate in road traffic while minimising the adverse effects on our environment This goal is pursued by road safety measures ranging from safety oriented road design to driver assistance systems The latter require exteroceptive sensors to acquire information about the vehicle's current environment In this thesis an efficient resource allocation algorithm for automotive vision systems is proposed The novel system architecture is shown to efficiently allocate both high resolution sensor resources and computational expensive processes based upon low resolution sensor data The Pareto efficient decision making process used for resource allocation is formalised implemented and evaluated using road traffic test sequences acquired by a multi modal sensor system on a test vehicle provided by AUDI AG

Software Architecture 2 Mourad Chabane Oussalah,2014-06-02 Over the past 20 years software architectures have significantly contributed to the development of complex and distributed systems Nowadays it is recognized that one of the critical problems in the design and development of any complex software system is its architecture i e the organization of its architectural elements Software Architecture presents the software architecture paradigms based on objects components services and models as well as the various architectural techniques and methods the analysis of architectural qualities models of representation of architectural templates and styles their formalization validation and testing and finally the engineering approach in which these consistent and autonomous elements can be tackled
