*An Introduction to NURBS* David F. Rogers, 2001 NURBS Non uniform Rational B Splines are the computer graphics industry standard for curve and surface description They are now incorporated into all standard computer aided design and drafting programs for instance Autocad They are also extensively used in all aspects of computer graphics including much of the modeling used for special effects in film and animation consumer products robot control and automobile and aircraft design So the topic is particularly important at this time because NURBS are really at the peak of interest as applied to computer graphics and CAD of all kind

*An Introduction to Structural Optimization* Peter W. Christensen, Anders Klarbring, 2008-10-20 This book has grown out of lectures and courses given at Linköping University Sweden over a period of 15 years It gives an introductory treatment of problems and methods of structural optimization The three basic classes of geometrical optimization problems of mechanical structures i.e. size shape and topology optimization are treated The focus is on concrete numerical solution methods for discrete and finite element discretized linear elastic structures The style is explicit and practical mathematical proofs are provided when arguments can be kept elementary but are otherwise only cited while implementation details are frequently provided Moreover since the text has an emphasis on geometrical design problems where the design is represented by continuously varying frequently very many variables so called first order methods are central to the treatment These methods are based on sensitivity analysis i.e. on establishing first order derivatives for objectives and constraints The classical first order methods that we emphasize are CONLIN and MMA which are based on explicit convex and separable approximations It should be remarked that the classical and frequently used so called optimality criteria method is also of this kind It may also be noted in this context that zero order methods such as response surface methods surrogate models neural networks genetic algorithms etc essentially apply to different types of problems than the ones treated here and should be presented elsewhere

*Forum Bauinformatik 2009* Petra von Both, 2009 [An Introduction to the Locally Corrected Nyström Method](#) Andrew Peterson, Malcolm Bibby, 2022-05-31 This lecture provides a tutorial introduction to the Nyström and locally corrected Nyström methods when used for the numerical solutions of the common integral equations of two dimensional electromagnetic fields These equations exhibit kernel singularities that complicate their numerical solution Classical and generalized Gaussian quadrature rules are reviewed The traditional Nyström method is summarized and applied to the magnetic field equation for illustration To obtain high order accuracy in the numerical results the locally corrected Nyström method is developed and applied to both the electric field and magnetic field equations In the presence of target edges where current or charge density singularities occur the method must be extended through the use of appropriate singular basis functions and special quadrature rules This extension is also described

**IGA: Non-conforming Coupling and Shape Optimization of Complex Multipatch Structures, Volume 1** Robin Bouclier,Thibaut Hirschler,2022-06-06 Isogeometric analysis IGA consists of using the same higher order and smooth spline functions for the representation of geometry in Computer Aided Design as for the approximation of solution fields in Finite Element Analysis Now about fifteen years after its creation substantial works are being reported in IGA which make it very competitive in scientific computing This book provides a contemporary vision of IGA by first discussing the current challenges in achieving a true bridge between design and analysis then proposing original solutions that answer the issues from an analytical point of view and eventually studying the shape optimization of structures which is one of the greatest applications of IGA To handle complex structures a full analysis to optimization framework is developed based on non invasive coupling parallel domain decomposition and immersed geometrical modeling This seems to be very robust taking on all of the attractive features of IGA the design analysis link numerical efficiency and natural regularization giving us the opportunity to explore new types of design
