Behavior, Design and Construction of Horizontally Curved Composite Steel Box Girder Bridges [microform] Muayad Whyib Aldoori, 2004

Horizontally curved girder bridges have been used considerably in recent years in highly congested urban areas. However, although significant research on physical testing and advanced analysis has been underway for the past decade, the practical employment of many recommendations has not been achieved by the engineering community, nor have standards reflecting this work been brought into practice. The design process of curved composite bridges involves tracking the stresses and the potential failure change in the girders during erection, construction, and service loading stages. For structural safety and serviceability, the designer estimates the stresses induced within the bridge and assures that they do not exceed the applicable specified limit state as required in bridge design standards. However, the designer may be concerned about the level of approximation that is used in his estimate or even the applicability of the underlying theory. To answer this question and provide the designer with more insight into the behavior of the curved bridges, the field testing during construction and service loading of a curved bridge located near Baltimore, Maryland, is re-examined here using linear elastic three-dimensional finite element modeling. Comparisons are made between the finite element results and the measured results. Finally, to facilitate the finite element modeling effort for use by a designer, ANSYS Parametric Design Language (APDL) capabilities are used here to develop an analysis design tool for Bath Tub style curved steel girder bridges. This tool is then used to evaluate the effects of several important design variables on the response and behavior of the girders during the construction phase. This study demonstrates the ability of finite element modeling to assess the stiffness, serviceability, performance, buckling behavior, and ultimate strength of curved bridges during construction, and it is a major step towards a performance-based approach to design for stability. The level of safety or reliability that would be available during the erection and the construction processes of horizontally curved girder bridges represents another major concern for the designer. A three-span continuous curved box girder bridge in Houston, Texas, is used in this study as an example reflecting current detailing and fabricating practice, and it is chosen for a detailed evaluation of the structural safety reliability during

the erection and construction process This task involves simulating the girder erection and concrete slab placement sequence of the bridge using comprehensive nonlinear three dimensional finite element modeling Analysis and Design of Curved Girder Bridges Mohiuddin Ali Khan,2017-01-01 Written by and expert with 35 years of experience as design manager for the New Jersey Department of Transportation New Jersey Turnpike Authority and the Washington Metropolitan Area Transportation Authority the objective of Analysis and Design of Curved Girder Bridges is to assist highway and transportation engineers meet and overcome the various challenges encountered when designing Curved Girder Bridges Analysis and Design of Curved Girder Bridges four part treatment starts with a clear and rigorous exposition of the various codes which govern design including American Association of State Highway and Transportation Officials Federal Highway Administration and the Eurocode for Dynamic Factor Dynamic Loading and Load Combinations This is followed by three additional parts that addresses the unique aspects related to analysis methods Including Finite Elements Modeling Load Models Resistance Models and Statistical Analysis of Stress Ratios Analytical methods including Finite Element Modeling and Statistical Analysis of Stress Ratios Applications and Solved Examples including 1 Span Simply Supported Bridges 2 Span Continuous Structure and 3 Span Continuous Bridges Provides design methods and structural details for the superstructure and substructures for Curved Girder Bridges Finite Element Analysis and Design of Steel and Steel-Concrete Composite Bridges Ehab Ellobody,2014-05-30 In recent years bridge engineers and researchers are increasingly turning to the finite element method for the design of Steel and Steel Concrete Composite Bridges However the complexity of the method has made the transition slow Based on twenty years of experience Finite Element Analysis and Design of Steel and Steel Concrete Composite Bridges provides structural engineers and researchers with detailed modeling techniques for creating robust design models The book s seven chapters begin with an overview of the various forms of modern steel and steel concrete composite bridges as well as current design codes This is followed by self contained chapters concerning nonlinear material behavior of the bridge components applied loads and stability of steel and steel concrete composite bridges and design of steel and steel concrete composite bridge components Constitutive models for construction materials including material non linearity and geometric non linearity The mechanical approach including problem setup strain energy external energy and potential energy mathematics behind the method Commonly available finite elements codes for the design of steel bridges Explains how the design information from Finite Element Analysis is incorporated into Building information models to obtain quantity information cost analysis **Dynamic Analysis and Testing of a Curved Girder Bridge** Matthew R. Tilley,Furman W. Barton,José Pantaleon Gomez,2006 As a result of increasing highway construction and expansion a corresponding need to increase traffic capacity in heavily populated areas and ever increasing constraints on available land for transportation use there has been an increasing demand for alignment geometries and bridge configurations that result in more efficient use of available space As a result of this demand there has been a steady increase

in the use of curved girder bridges over the past 30 years. Despite extensive research relating to the behavior of these types of structures, a thorough understanding of curved girder bridge response, especially relating to dynamic behavior, is still incomplete. To develop an improved rational set of design guidelines, the Federal Highway Administration (FHWA) initiated the Curved Steel Bridge Research Project in 1992. As part of this project, FHWA constructed a full scale model of a curved steel girder bridge at its Turner Fairbank Structures Laboratory. This full scale model made it possible to conduct numerous tests and collect a significant amount of data relating to the static behavior of a curved girder bridge. However, relatively little information has been available on the dynamic response of curved girder bridges, and this type of information is needed before a complete design specification can be developed. The objective of this study was to develop a finite element model using SAP2000 that could be used for predicting and evaluating the dynamic response of a curved girder bridge. Models of the FHWA curved girder bridge were developed using both beam and shell elements, and response information compared with experimental data and with analytical data from other finite element codes. The experimental data were obtained during dynamic testing of the full scale bridge in the Turner Fairbank Structures Laboratory, and analytical response information was provided from finite element models of the bridge using ANSYS and ABAQUS. The primary focus of the study was the prediction of frequencies and mode shapes of the full scale curved girder, both with and without a deck. Both experimental and analytical frequencies and mode shapes were calculated and compared. Although the more refined ANSYS and ABAQUS models provided response data that compared more favorably with the experimental data, the SAP2000 models were found to be more than adequate for predicting the lower modes and frequencies of the bridge.

This second edition of *Finite Element Analysis and Design of Steel and Steel Concrete Composite Bridges* is brought fully up to date and provides structural engineers, academics, practitioners, and researchers with a detailed, robust, and comprehensive combined finite modeling and design approach. The book's eight chapters begin with an overview of the various forms of modern steel and steel concrete composite bridges, current design codes, American, British, and Eurocodes, nonlinear material behavior of the bridge components, and applied loads and stability of steel and steel concrete composite bridges. This is followed by self-contained chapters concerning design examples of steel and steel concrete composite bridge components, as well as finite element modeling of the bridges and their components. The final chapter focuses on finite element analysis and the design of composite highway bridges with profiled steel sheeting. This volume will serve as a valuable reference source addressing the issues, problems, challenges, and questions on how to enhance the design of steel and steel concrete composite bridges, including highway bridges with profiled steel sheeting, using finite element
