Plant & Animal Adaptations

The collage features several educational resources:

- Background Illustration:** A serene scene of three deer (two adults and one fawn) standing in a snowy forest with evergreen trees.
- Laptop Screen:** Displays a digital presentation titled "5TH GRADE SCIENCE: Plant and Animal Adaptations". It includes a table of contents and several slides with text, images, and diagrams.
- Printed Worksheets:**
 - Worksheet 1:** Titled "Plant and Animal Adaptations", it includes a section for "Research on an animal that lives in its habitat" and a table for "Examples".
 - Worksheet 2:** Titled "Plant and Animal Adaptations", it includes a section for "What adaptations would a plant living in a tree need that a plant living in a pond would not need?" and a section for "Circle the animal that..." with illustrations of a fish and a bird.
 - Worksheet 3:** Titled "Plant and Animal Adaptations", it includes a section for "What type of habitat does..." and a section for "How are these two fish similar?".
- Text on the Right:**
 - Young deer, called fawns, have spots on their fur.** When a fawn is curled up on the forest floor, the spots help camouflage it.
 - Most trees in temperate forests are deciduous.** Their leaves change color and become longer in the fall. They lose their leaves before winter begins to help water loss in the cold, dry air. Before the leaves fall, deciduous trees pull the nutrients from the leaves into the trunk and stems. When the weather becomes warm in spring, the trees sprout new leaves.
 - Tropical Rainforests**
Tropical rainforests, often called jungles, are warm and rainy all year. As a result, different kinds of plants live there. The tallest trees reach out over the top to get sunlight. Another layer of trees spreads below those canopies. With so much sunlight reaching the forest floor, a third layer of plants lives close to the ground. These are called epiphytes. Some plants, called vines, have adapted to grow by hanging from the branches to reach the forest floor.
