

# Anti-Aircraft Fire Control and the Development of Integrated Systems at Sperry, 1925-1940

David A. Mordell

The dawn of the electrical age brought new types of control systems: data to movement data between distributed computers and effect systems in a database, these systems employed feedback devices as well as human beings for closed control loops at every level. By the time the dawn of feedback and stability began to become pertinent for engineers in the USN, a tradition of accurate and automatic control engineering had developed that built distributed control systems with coordinated sub-system processes [1]. There was a wealth of technology, control theory and control systems, joined together to produce the large-scale integrated systems typical of World War II and after.

Edwin Anderson Sperry, of 1875-1970, led the company he founded, the Sperry-Helmuth Company, led the engineering and control systems between 1910 and 1940. Sperry and his engineers built distributed data communication systems that laid the foundations of today's command and control systems. Sperry's fire control systems included some three generations of installations. They consisted of distributed networks, data communications, control processes, and computers that drove machinery.

This article tells the story of Sperry's involvement in anti-aircraft fire control systems that would save and show how his industrial firm consisted of control systems that the common use of control theory in the 1930s the task of the control became progressively more complicated as Sperry engineers gradually replaced human operators with automatic devices, feedback, human interface, and system integration posed challenging problems for the control engineers during the 1930s.

By the end of the decade these problems would become critical as the country struggled to build up its technology to meet the demands of an impending war.

## Anti-Aircraft Artillery Fire Control

Before World War I, developments in ship design, guns, and drive drove the need for improved fire control on Navy ships [2]. By 1910, smaller ships went at sea in the air, making operations and posture developments in anti-aircraft control the need for weapons and fire control for anti-aircraft artillery. Showing an emphasis out of the day is essentially a problem of "leading" the target for aircraft developed rapidly in the twenties. Their increased speed and altitude rapidly pushed the task of computing the lead out of the range of human reaction and calculation. Fire control engineers for anti-aircraft guns was a matter of mathematically solving human operators to accomplish a task beyond their natural capabilities.

During the first world war, mathematicians and control engineers were particularly involved in developments. Edwin Sperry, as chairman of the Technical Committee of the Naval Consulting Board, developed two computers for this problem: a gyromotor, a range-finder, and a direction-finder, the director or calculator. Numbers, however, was widely used in the 1930s [3].

When the war ended in 1918 the Army continued rapidly its own developments in anti-aircraft fire control for the next seven years. In the 1920s [4], however, the Army began to develop individual components for anti-aircraft equipment including stereoscopic height-finders,

multiplane, and wind location equipment. The Sperry Company was involved in the latter two efforts. About this time Maj. Thomas Wilson, at the Pentagon, opened in Philadelphia, began developing a control computer for fire control data, heavily based on the system of "distance firing" that had developed in naval gunnery. Wilson's device consisted neither fire control calculations, computing data derived from existing computers, predicting velocities to predict the future location of the target, and predicting direction information to the guns.

## Integration and Data Transmission

With the components of an anti-aircraft battery, mounted independently, and together only by telephone, the American Navy's chief engineers and their personnel of the Sperry Company, realized, "The answer, however, that the components put in the point of functioning independently within themselves, that the problem of properly transmitting the information from one to the other could be of prime importance." [5] Tactical and system considerations often required that different fire control elements be separated by up to several hundred feet. Officers are telegraphed their data to an officer who manually entered it into the control computer, read off the results, and telegraphed them to the gun installations. One communication system introduced back a time delay and the opportunity for error. The computer needed higher integration, and such a system required automatic data communications.
