Precast Segmental Box Girders Fadzli Mohamed Nazri,Mohd Azrulfitri Mohd Yusof,Moustafa Kassem,2019-02-09 This book explores the fundamentals of the elastic behaviour of erected precast segmental box girders SBG when subjected to static load as well as the construction process casting and erection work involved It analyzes and compares the experimental results with those obtained using the finite element method and theoretical calculations A short term deflection analysis for different loads is obtained by determining the maximum deflection stress and strain value of single span precast SBG under a variety of transversal slope The outcome of this work provides a better understanding of the behaviour of precast SBG in terms of structural responses as well as defects so that maintenance work can then be focused on the critical section at mid span area specifically for the bridge project longitudinally and transversely The book is of interest to industry professionals involved in conducting static load tests on bridges and all researchers designers and engineers seeking to validate experimental work with numerical and analytical approaches *Finite Element Analysis of Prestressed Concrete Box Girder Bridge* Rebaz Abdulghafoor Othman,2013 *Structural Model of a Prestressed Concrete Box Girder Bridge* ,1971

Concrete Box Girder Bridges Oris H. Degenkolb,1977 **Structural Model of a Prestressed Concrete Box Girder Bridge** ,1972 *Behavior of a One Cell Prestressed Concrete Box Girder Bridge* Amar Hadj-Arab,1987 **UCB SESM 85 02** ,1985 **Adjacent Precast Prestressed Concrete Box Girder Bridges Transversely Post-tensioned at Top Flanges Only** Shady Nasry Badie Labib,2021 Adjacent precast prestressed concrete box girders are widely used in short and medium span bridges in North America Adjacent box girders are connected at their interface using partial or full depth grouted shear keys Typically transverse post tensioning TPT is applied through diaphragms at discrete locations along the bridge span to improve the transverse load distribution and control differential deflections Nevertheless diaphragms only reduce the differential deflection between girders and do not eliminate it In addition the provision of transverse diaphragms is associated with an increased cost and time The main objective of this research program is to investigate the feasibility of eliminating the transverse diaphragms by applying TPT in the top flange of the girders The effect of applying TPT in the top flange of the girders instead of being accommodated in discrete rigid diaphragms on the transverse load distribution is studied The research program comprised two phases experimental and numerical The experimental phase consisted of four

different tests on a one third scale bridge model 1 Strain distribution test uncracked shear key 2 Load distribution test uncracked shear key 3 Load distribution test cracked shear key and 4 Ultimate load test On the other hand the numerical phase included the construction of a finite element model FEM to validate the experimental results of the tested bridge The validated FEM was then used to study the influence of varying several parameters including the presence of concrete topping wheel load location and the width of the bridge on the transverse load distribution behavior of box girder bridges Results demonstrated the efficiency of distributing the TPT force at a shorter spacing along the length of the bridge in producing the minimum required concrete prestress In addition the influence of TPT force and spacing on the transverse load distribution behavior was found insignificant during the simulated service condition fully intact or partially cracked shear keys However at failure the presence of TPT added redundancy to the bridge model and mitigated any sudden failure when shear keys were fully cracked Furthermore the presence of concrete topping reduced mid span deflection up to 25%

The Temperature Problem in a Prestressed Box Girder Bridge P. C. Hoffman, R. M. McClure, H. H. West, 1984 **Long Term Monitoring of a Prestressed Concrete Box Girder Bridge by Acoustic Emission - Planning and Executing** Malgorzata Kalicka, Thomas Vogel (Civil engineer, Switzerland), 2012 **Strengthening of Two Prestressed Segmental Box Girder Bridges**, 1990

Through the years significant cracks and critical deflections of the central span were monitored in the first segmental cast in place prestressed concrete bridge constructed in North America Structural analysis following usual standards showed extensive tension zones in the bottom slab of the end and centre spans An examination of the drawings also revealed that the end segments were not properly connected to the rest of the bridge by prestressing Moreover a lack of vertical reinforcement was detected in the interior face of the box girder webs near their junction with the top slab The lack of longitudinal prestressing was corrected by the addition of external tendons placed on both sides of each web and anchored on concrete blocks connected to the webs with prestressed bars To correct the transverse flexural problem high tensioned bars were placed in concrete columns tied up to the interior face of the webs and stressed from the top of the slab

Strengthening works were carried out during the summer of 1988 without traffic interruption For the covering abstract of the Conference see IRRD Abstract no 807839 **Behaviour of a One Cell Prestressed Concrete Box Girder Bridge**

Experimental Study Amar Hadj-arab, 1987 An experimental study of the behaviour of a 1/7/10 scale direct physical model of a simply supported single span one cell prestressed concrete box girder bridge is presented The experimental techniques developed for construction and the instrumentation required during testing of the bridge model are summarized Variation of the flexural stiffness and the dynamic characteristics such as the damping ratio and the fundamental natural frequency of the bridge model at different level of damage are presented **Effect of Diaphragms in Skew Prestressed Concrete Box**
