Mathematics for the Life Sciences Glenn Ledder, 2013-08-29 Mathematics for the Life Sciences provides present and future biologists with the mathematical concepts and tools needed to understand and use mathematical models and read advanced mathematical biology books It presents mathematics in biological contexts focusing on the central mathematical ideas and providing detailed explanations The author assumes no mathematics background beyond algebra and precalculus Calculus is presented as a one chapter primer that is suitable for readers who have not studied the subject before as well as readers who have taken a calculus course and need a review This primer is followed by a novel chapter on mathematical modeling that begins with discussions of biological data and the basic principles of modeling The remainder of the chapter introduces the reader to topics in mechanistic modeling deriving models from biological assumptions and empirical modeling using data to parameterize and select models The modeling chapter contains a thorough treatment of key ideas and techniques that are often neglected in mathematics books It also provides the reader with a sophisticated viewpoint and the essential background needed to make full use of the remainder of the book which includes two chapters on probability and its applications to inferential statistics and three chapters on discrete and continuous dynamical systems The biological content of the book is self contained and includes many basic biology topics such as the genetic code Mendelian genetics population dynamics predator prey relationships

epidemiology and immunology The large number of problem sets include some drill problems along with a large number of case studies The latter are divided into step by step problems and sorted into the appropriate section allowing readers to gradually develop complete investigations from understanding the biological assumptions to a complete analysis

Mathematical Modeling for the Life Sciences Jacques Istas,2005-06-09 Provides a wide range of mathematical models currently used in the life sciences Each model is thoroughly explained and illustrated by example Includes three appendices to allow for independent reading

Mathematics for the Life Sciences Erin N. Bodine,Suzanne Lenhart,Louis J. Gross,2014-08-17 An accessible undergraduate textbook on the essential math concepts used in the life sciences The life sciences deal with a vast array of problems at different spatial temporal and organizational scales The mathematics necessary to describe model and analyze these problems is similarly diverse incorporating quantitative techniques that are rarely taught in standard undergraduate courses This textbook provides an accessible introduction to these critical mathematical concepts linking them to biological observation and theory while also presenting the computational tools needed to address problems not readily investigated using mathematics alone Proven in the classroom and requiring only a background in high school math Mathematics for the Life Sciences doesn't just focus on calculus as do most other textbooks on the subject It covers deterministic methods and those that incorporate uncertainty problems in discrete and continuous time probability graphing and data analysis matrix modeling difference equations differential equations and much more The book uses MATLAB throughout explaining how to use it write code and connect models to data in examples chosen from across the life sciences Provides undergraduate life science students with a succinct overview of major mathematical concepts that are essential for modern biology Covers all the major quantitative concepts that national reports have identified as the ideal components of an entry level course for life science students Provides good background for the MCAT which now includes data based and statistical reasoning Explicitly links data and math modeling Includes end of chapter homework problems end of unit student projects and select answers to homework problems Uses MATLAB throughout and MATLAB m files with an R supplement are available online Prepares students to read with comprehension the growing quantitative literature across the life sciences A solutions manual for professors and an illustration package is available

Biocalculus: Calculus, Probability, and Statistics for the Life Sciences James Stewart,Troy Day,2015-06-30 BIOCALCULUS CALCULUS PROBABILITY AND STATISTICS FOR THE LIFE SCIENCES shows students how calculus relates to biology with a style that maintains rigor without being overly formal The text motivates and illustrates the topics of calculus with examples drawn from many areas of biology including genetics biomechanics medicine pharmacology physiology ecology epidemiology and evolution to name a few Particular attention has been paid to ensuring that all applications of the mathematics are genuine and references to the primary biological literature for many of these has been provided so that students and instructors can explore the applications in greater depth Although the focus is on the interface

between mathematics and the life sciences the logical structure of the book is motivated by the mathematical material. Students will come away with a sound knowledge of mathematics, an understanding of the importance of mathematical arguments, and a clear understanding of how these mathematical concepts and techniques are central in the life sciences.

Modeling Life Alan Garfinkel, Jane Shevtsov, Yina Guo, 2017-09-06. This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior. From predator-prey populations in an ecosystem to hormone regulation within the body, the natural world abounds in dynamical systems that affect us profoundly. Complex feedback relations and counter-intuitive responses are common in nature; this book develops the quantitative skills needed to explore these interactions. Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book. The use of Euler's method makes nonlinear examples tractable and accessible to a broad spectrum of early-stage undergraduates, thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum. Tools are developed within numerous relevant examples with an emphasis on the construction, evaluation, and interpretation of mathematical models throughout. Encountering these concepts in context, students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking. Examples range broadly, exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm. Each scenario relies only on an interest in the natural world; no biological expertise is assumed of student or instructor. Building on a single prerequisite of Precalculus, the book suits a two-quarter sequence for first or second-year undergraduates and meets the mathematical requirements of medical school entry. The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich, real-world framework. In all cases, the focus is clear: how does the math help us understand the science?

Dynamical System Models In The Life Sciences And Their Underlying Scientific Issues Frederic Y M Wan, 2017-08-16. Broadly speaking, there are two general approaches to teaching mathematical modeling: 1) the case study approach and 2) the method-based approach that teaches mathematical techniques with applications to relevant mathematical models. This text emphasizes instead the scientific issues for modeling different phenomena. For the natural or harvested growth of a fish population, we may be interested in the evolution of the population: whether it reaches a steady state equilibrium or cycle, stable or unstable with respect to a small perturbation from equilibrium, or whether a small change in the environment would cause a catastrophic change, etc. Each scientific issue requires an appropriate model and a different set of mathematical tools to extract information from the model. Models examined are chosen to help explain or justify empirical observations, such as: cocktail drug treatments are more effective; and regenerations after injuries or illness are fast-tracked compared to original developments. Volume I of this three-volume set limits its scope to phenomena and scientific issues that are modeled by

ordinary differential equations ODE Scientific issues such as signal and wave propagation diffusion and shock formation involving spatial dynamics to be modeled by partial differential equations PDE will be treated in Vol II Scientific issues involving randomness and uncertainty are examined in Vol III

Mathematics and Life Sciences Alexandra V. Antoniouk, Roderick Melnik, 2013 In addition the book contains several state of the art surveys at the interface of mathematics and life sciences that would benefit a larger interdisciplinary community

Modeling and Simulation in Medicine and the Life Sciences Frank C. Hoppensteadt, Charles S. Peskin, 2012-12-06 Mathematics in Medicine and the Life Sciences grew from lectures given by the authors at New York University the University of Utah and Michigan State University The material is written for students who have had but one term of calculus but it contains material that can be used in modeling courses in applied mathematics at all levels through early graduate courses Numerous exercises are given as well and solutions to selected exercises are included Numerous illustrations depict physiological processes population biology phenomena models of them and the results of computer simulations Mathematical models and methods are becoming increasingly important in medicine and the life sciences This book provides an introduction to a wide diversity of problems ranging from population phenomena to demographics genetics epidemics and dispersal in physiological processes including the circulation gas exchange in the lungs control of cell volume the renal counter current multiplier mechanism and muscle mechanics to mechanisms of neural control Each chapter is graded in difficulty so a reading of the first parts of each provides an elementary introduction to the processes and their models Materials that deal with the same topics but in greater depth are included later Finally exercises and some solutions are given to test the reader on important parts of the material in the text or to lead the reader to the discovery of interesting extensions of that material

Mathematical Modeling in the Life Sciences Paul Doucet, Peter B. Sloep, 1992-01-01 Combining mathematics biology statistics and computer applications this text applies mathematical methods to the solution of biological and related problems It demonstrates how to formulate mathematical models of dynamic processes and how to study their behaviour analytically and numerically

Model Based Inference in the Life Sciences David R. Anderson, 2007-12-22 This textbook introduces a science philosophy called information theoretic based on Kullback Leibler information theory It focuses on a science philosophy based on multiple working hypotheses and statistical models to represent them The text is written for people new to the information theoretic approaches to statistical inference whether graduate students post docs or professionals Readers are however expected to have a background in general statistical principles regression analysis and some exposure to likelihood methods This is not an elementary text as it assumes reasonable competence in modeling and parameter estimation
