

FLUID MECHANICS

FLUID KINEMATICS

Fluid Kinematics gives the geometry of fluid motion. It is a branch of fluid mechanics, which describes the fluid motion, and it's consequences without consideration of the nature of forces causing the motion. Fluid kinematics is the study of velocity as a function of space and time in the flow field. From velocity, pressure variations and hence, forces acting on the fluid can be determined.

VELOCITY FIELD

Velocity at a given point is defined as the instantaneous velocity of the fluid particle, which at a given instant is passing through the point. It is represented by $V = V(x, y, z, t)$. Vectorially, $V = u\mathbf{i} + v\mathbf{j} + w\mathbf{k}$ where u, v, w are three scalar components of velocity in x, y and z directions and (t) is the time. Velocity is a vector quantity and velocity field is a vector field.

FLOW PATTERNS

Fig. Flow Patterns

Fluid Mechanics is a visual subject. Patterns of flow can be visualized in several ways. Basic types of line patterns used to visualize flow are streamline, path line, streak line and time line.

- (a) Stream line is a line, which is everywhere tangent to the velocity vector at a given instant.
- (b) Path line is the actual path traversed by a given particle.
- (c) Streak line is the locus of particles that have earlier passed through a prescribed point.
- (d) Time line is a set of fluid particles that form a line at a given instant.
