Exploratory Data Analysis Using Fisher Information Roy Frieden,Robert A. Gatenby,2010-05-27 Sustainability is often used in a qualitative sense However there is at present a great need to quantitatively measure and monitor its many qualitative aspects in real systems Real systems are regarded as sustainable if they can maintain their current desirable productivity and character without creating unfavorable conditions elsewhere or in the future 1 4 Sustainability therefore incorporates both concern for the future of the current system temporal sustainability and concern about the degree to which some areas and cultures of the planet are improved at the expense of other areas and cultures spatial sustainability That is sustainability is to hold over both space and time Sustainability encompasses many disciplines For example economic systems are not sustainable if they degrade their natural resource base and impoverish some sectors of the human population 5 6 Indices are needed that will measure sustainability through time and over space at several scales These indices must also have the ability to aggregate the many disciplinary facets of sustainability often incorporated through a large number of environmental social and economic variables Such a multidisciplinary dynamic system can be regarded as sustainable if it

Diebold,Kamil Yilmaz,2015-02-03 Connections among different assets asset classes portfolios and the stocks of individual institutions are critical in examining financial markets Interest in financial markets implies interest in underlying macroeconomic fundamentals In Financial and Macroeconomic Connectedness Frank Diebold and Kamil Yilmaz propose a simple framework for defining measuring and monitoring connectedness which is central to finance and macroeconomics These measures of connectedness are theoretically rigorous yet empirically relevant The approach to connectedness proposed by the authors is intimately related to the familiar econometric notion of variance decomposition The full set of variance decompositions from vector auto regressions produces the core of the connectedness table The connectedness table makes clear how one can begin with the most disaggregated pair wise directional connectedness measures and aggregate them in various ways to obtain total connectedness measures The authors also show

that variance decompositions define weighted directed networks so that these proposed connectedness measures are intimately related to key measures of connectedness used in the network literature After describing their methods in the first part of the book the authors proceed to characterize daily return and volatility connectedness across major asset stock bond foreign exchange and commodity markets as well as the financial institutions within the U S and across countries since late 1990s These specific measures of volatility connectedness show that stock markets played a critical role in spreading the volatility shocks from the U S to other countries Furthermore while the return connectedness across stock markets increased gradually over time the volatility connectedness measures were subject to significant jumps during major crisis events This book examines not only financial connectedness but also real fundamental connectedness In particular the authors show that global business cycle connectedness is economically significant and time varying that the U S has disproportionately high connectedness to others and that pairwise country connectedness is inversely related to bilateral trade surpluses
