## **From NEDC To WLTP Effect On The Type Approval Co:**

*From NEDC to WLTP ,2017* The present report summarises the work carried out by the European Commission s Joint Research Centre to estimate the impact of the introduction of the new type approval procedure the Worldwide Light duty vehicle Test Procedure WLTP on the European car fleet CO2 emissions To this aim a new method for the calculation of the European light duty vehicle fleet CO2 emissions combining simulation at individual vehicle level with fleet composition data is adopted The method builds on the work carried out in the development of CO2MPAS the tool developed by the Joint Research Centre to allow the implementation of European Regulations 1152 and 1153 2017 which set the conditions to amend the European CO2 targets for passenger cars and light commercial vehicles due to the introduction of the WLTP in the European vehicle type approval process Results show an average WLTP to NEDC CO2 emissions ratio in the range 1 1 1 4 depending on the powertrain and on the NEDC CO2 emissions In particular the ratio tends to be higher for vehicles with lower NEDC CO2 emissions in all powertrains the only exception being with the plug in hybrid electric vehicles PHEVs In this case indeed the WLTP to NEDC CO2 emissions ratio quickly decreases to values that can be also lower than 1 as the electric range of the vehicle increases

**Powertrain Systems for Net-Zero Transport** Institution of Mechanical Engineers (IMe, 2021-12-23) The transport sector continues to shift towards alternative powertrains particularly with the UK Government's announcement to end the sale of petrol and diesel passenger cars by 2030 and increasing support for alternatives. Despite this announcement the internal combustion continues to play a significant role both in the passenger car market through the use of hybrids and sustainable low carbon fuels as well as a key role in other sectors such as heavy duty vehicles and off highway applications across the globe. Building on the industry leading IC Engines conference the 2021 Powertrain Systems for Net Zero Transport conference 7-8 December 2021 London UK focussed on the internal combustion engine's role in Net Zero transport as well as covered developments in the wide range of propulsion systems available electric fuel cell sustainable fuels etc and their associated powertrains. To achieve the net zero transport across the globe the life cycle analysis of future powertrain and energy was also discussed. Powertrain Systems for Net Zero Transport provided a forum for engine fuels e machine fuel cell and powertrain experts to look closely at developments in powertrain technology required to meet the demands of the net zero future and global competition in all sectors of the road transportation off highway and stationary power industries.

*Annual Report JRC European Commission. Joint Research Centre, 2017 Internal Combustion Engines and Powertrain Systems for Future Transport 2019* 0 IMECHE, 2020-03-09 With the changing landscape of the transport sector there are also alternative powertrain systems on offer that can run independently of or in conjunction with the internal combustion IC engine. This shift has actually helped the industry gain traction with the IC Engine market projected to grow at 4.67% CAGR during the forecast period 2019-2025. It continues to meet both requirements and challenges through continual technology advancement and innovation from the latest research. With this in mind the contributions in Internal Combustion Engines and Powertrain Systems for Future Transport 2019 not only cover the particular issues for the IC engine market but also reflect the impact of alternative powertrains on the propulsion industry. The main topics include Engines for hybrid powertrains and electrification IC engines Fuel cells E machines Air path and other technologies achieving performance and fuel economy benefits Advances and improvements in combustion and ignition systems Emissions regulation and their control by engine and after treatment
