Friction Stir Welding and Processing Rajiv Sharan Mishra, Partha Sarathi De, Nilesh Kumar, 2014-08-31

Theory of Thermomechanical Processes in Welding Andrzej Sluzalec, 2005-03-11 The main purpose of this book is to provide a unified and systematic continuum approach to engineers and applied physicists working on models of deformable welding material The key concept is to consider the welding material as a thermodynamic system Significant achievements include thermodynamics plasticity fluid flow and numerical methods Having chosen point of view this work does not intend to reunite all the information on the welding thermomechanics The attention is focused on the deformation of welding material and its coupling with thermal effects Welding is the process where the interrelation of temperature and deformation appears throughout the influence of thermal field on material properties and modification of the extent of plastic zones Thermal effects can be studied with coupled or uncoupled theories of thermomechanical response A majority of welding problems can be satisfactorily studied within an uncoupled theory In such an approach the temperature enters the stress strain relation through the thermal dilatation and influences the material constants The heat conduction equation and the relations governing the stress field are considered separately In welding a material is either in solid or in solid and liquid states The flow of metal and solidification phenomena make the welding process very complex The automobile aircraft nuclear and ship industries are experiencing a rapidly growing need for tools to handle welding problems The effective solutions of complex problems in welding became possible in the last two decades because of the vigorous development of numerical methods for thermal and mechanical analysis
