

Second-Order Lowpass and Bandpass Filters

4-9

If $R_3 = \infty$, then $Q = \infty$.

P4.10.1

(b) P4.10.1 is the simulation circuit. Measured maximum gain of 24.07 dB happens at 64.15 kHz; -3 -dB cutoff frequencies are 34.34 kHz and 121.2 kHz; bandwidth of the peak is 86.86 kHz; Q is 0.740. When R_3 is removed, there is a very sharp peak indicating a high Q . Due to the non-ideality of the opamps, the Q is large but not infinite.

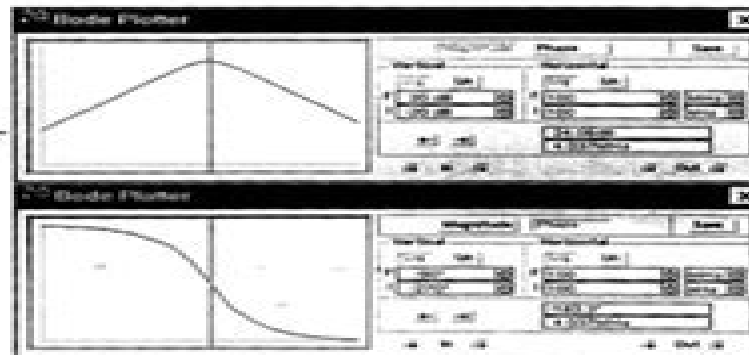

(c) For HA2542-2, $\omega_1 = 2\pi \times 9 \times 10^7$ rad/s, therefore $\omega_0 = \omega_1 \sqrt{G_2/G} = 2\pi \times 3.901 \times 10^8$ rad/s,
 $Q = R_3 \sqrt{G \cdot G_2} = 0.738$, and midband gain $H_M = R_3/R_1 = 16$ or 24.08 dB.

$$\therefore T_s(s) = \frac{-5.314 \times 10^8 s}{s^2 + 3.321 \times 10^7 s + 6.007 \times 10^{14}}$$

If $R_3 = \infty$, then $Q = \infty$.

Learning: An Integrative Introduction Joseph Bentsman, 2022-03-07 This book stems from a unique and a highly effective approach to introducing signal processing instrumentation diagnostics filtering control system integration and machine learning It presents the interactive industrial grade software testbed of mold oscillator that captures the distortion induced by beam resonance and uses this testbed as a virtual lab to generate input output data records that permit unravelling complex system behavior enhancing signal processing modeling and simulation background and testing controller designs All topics are presented in a visually rich and mathematically well supported but not analytically overburdened format By incorporating software testbed into homework and project assignments the narrative guides a reader in an easily followed step by step fashion towards finding the mold oscillator disturbance removal solution currently used in the actual steel production while covering the key signal processing control system integration and machine learning concepts The presentation is extensively class tested and refined though the six year usage of the book material in a required engineering course at the University of Illinois at Urbana Champaign **Personal Wireless Communications**

Scientific and Technical Aerospace Reports, 1989 **A New Perspective on Memorization in Recurrent Networks of Spiking Neurons** Patrick Murer, 2022-05-13 This thesis studies the capability of spiking recurrent neural network models to memorize dynamical pulse patterns or firing signals In the first part discrete time firing signals or firing sequences are considered A recurrent network model consisting of neurons with bounded disturbance is introduced to analyze simple local learning Two modes of learning memorization are considered The first mode is strictly online with a single pass through the data while the second mode uses multiple passes through the data In both modes the learning is strictly local quasi Hebbian At any given time step only the weights between the neurons firing or supposed to be firing at the previous time step and those firing or supposed to be firing at the present time step are modified The main result is an upper bound on the probability that the single pass memorization is not perfect It follows that the memorization capacity in this mode asymptotically scales like that of the classical Hopfield model which in contrast memorizes static patterns However multiple rounds memorization is shown to achieve a higher capacity with an asymptotically nonvanishing number of bits per connection synapse These mathematical findings may be helpful for understanding the functionality of short term memory and long term memory in neuroscience In the second part firing signals in continuous time are studied It is shown how firing signals containing firings only on a regular time grid can be robustly memorized with a recurrent network model In principle the corresponding weights are obtained by supervised quasi Hebbian multi pass learning The asymptotic memorization capacity is a nonvanishing number measured in bits per connection synapse as its discrete time analogon Furthermore the timing robustness of the memorized firing signals is investigated for different disturbance models The regime of disturbances where the relative occurrence time of the firings is preserved over a long time span is elaborated for the various disturbance models The proposed models have the potential for energy efficient self timed neuromorphic hardware implementations

Composite NUV Priors and Applications Raphael Urs Keusch, 2022-08-19 Normal with unknown variance NUV priors are a central idea of sparse Bayesian learning and allow variational representations of non Gaussian priors More specifically such variational representations can be seen as parameterized Gaussians wherein the parameters are generally unknown The

advantage is apparent for fixed parameters NUV priors are Gaussian and hence computationally compatible with Gaussian models Moreover working with linear Gaussian models is particularly attractive since the Gaussian distribution is closed under affine transformations marginalization and conditioning Interestingly the variational representation proves to be rather universal than restrictive many common sparsity promoting priors among them in particular the Laplace prior can be represented in this manner In estimation problems parameters or variables of the underlying model are often subject to constraints e g discrete level constraints Such constraints cannot adequately be represented by linear Gaussian models and generally require special treatment To handle such constraints within a linear Gaussian setting we extend the idea of NUV priors beyond its original use for sparsity In particular we study compositions of existing NUV priors referred to as composite NUV priors and show that many commonly used model constraints can be represented in this way

Using Local State Space Model Approximation for Fundamental Signal Analysis Tasks Elizabeth Ren, 2023-05-26

With increasing availability of computation power digital signal analysis algorithms have the potential of evolving from the common framewise operational method to samplewise operations which offer more precision in time This thesis discusses a set of methods with samplewise operations local signal approximation via Recursive Least Squares RLS where a mathematical model is fit to the signal within a sliding window at each sample Thereby both the signal models and cost windows are generated by Autonomous Linear State Space Models ALSSMs The modeling capability of ALSSMs is vast as they can model exponentials polynomials and sinusoidal functions as well as any linear and multiplicative combination thereof The fitting method offers efficient recursions subsample precision by way of the signal model and additional goodness of fit measures based on the recursively computed fitting cost Classical methods such as standard Savitzky Golay SG smoothing filters and the Short Time Fourier Transform STFT are united under a common framework First we complete the existing framework The ALSSM parameterization and RLS recursions are provided for a general function The solution of the fit parameters for different constraint problems are reviewed Moreover feature extraction from both the fit parameters and the cost is detailed as well as examples of their use In particular we introduce terminology to analyze the fitting problem from the perspective of projection to a local Hilbert space and as a linear filter Analytical rules are given for computation of the equivalent filter response and the steady state precision matrix of the cost After establishing the local approximation framework we further discuss two classes of signal models in particular namely polynomial and sinusoidal functions The signal models are complementary as by nature polynomials are suited for time domain description of signals while sinusoids are suited for the frequency domain For local approximation of polynomials we derive analytical expressions for the steady state covariance matrix and the linear filter of the coefficients based on the theory of orthogonal polynomial bases We then discuss the fundamental application of smoothing filters based on local polynomial approximation We generalize standard SG filters to any ALSSM window and introduce a novel class of smoothing filters based on polynomial fitting to running sums
