PSpice for Digital Signal Processing Paul

Tobin, 2022-05-31 PSpice for Digital Signal Processing is the last in a series of five books using Cadence Orcad PSpice version 10.5 and introduces a very novel approach to learning digital signal processing DSP DSP is traditionally taught using Matlab Simulink software but has some inherent weaknesses for students particularly at the introductory level The plug in variables and play nature of these software packages can lure the student into thinking they possess an understanding they don't actually have because these systems produce results quickly without revealing what is going on However it must be said that for advanced level work Matlab Simulink really excel In this book we start by examining basic signals starting with sampled signals and dealing with the concept of digital frequency The delay part which is the heart of DSP is explained and applied initially to simple FIR and IIR filters We examine linear time invariant systems starting with the difference equation and applying the z transform to produce a range of filter types i.e. low pass high pass and bandpass The important concept of convolution is examined and here we demonstrate the usefulness of the log command in Probe for giving the correct display to demonstrate the flip n slip method Digital oscillators including quadrature carrier generation are then examined Several filter design methods are considered and include the bilinear transform impulse invariant and window techniques Included also is a treatment of the raised cosine family of filters A range of DSP applications are then considered and include the Hilbert transform single sideband modulator using the Hilbert transform and quad oscillators integrators and differentiators Decimation and interpolation are simulated to demonstrate the usefulness of the multi sampling environment Decimation is also applied in a treatment on digital receivers Lastly we look at some musical applications for DSP such as reverberation echo using real world signals imported into PSpice using the program Wav2Ascii The zero forcing equalizer is dealt with in a simplistic manner and illustrates the effectiveness of equalizing signals in a receiver after transmission

Proceedings of All India Seminar on Advances in Product Development (APD-2006) R.K. Srivastava, 2006 Papers presented at an All India Seminar on Advances in Product Development 17-18 February 2006 **Biomedical Signal Processing** Neeraj Vyas, 2011 Communication System Design Using DSP Algorithms Steven A. Tretter, 2012-12-06 Designed for senior electrical engineering students this textbook explores the theoretical concepts of digital signal processing and communication systems by presenting laboratory experiments using real time DSP hardware The experiments are designed for the Texas Instruments TMS320C6701 Evaluation Module or TMS320C6711 DSK but can easily be adapted to other DSP boards Each chapter begins with a presentation of the required theory and concludes with instructions for performing experiments to implement the theory In the process of performing the experiments students gain experience in working with software tools and equipment commonly used in industry Real-time Digital Signal Processing Sen-Maw Kuo, 2003 **Fixed-Point Signal Processing** Wayne Padgett, David Anderson, 2022-06-01 This book is intended to fill the gap between the ideal precision digital signal processing DSP that is widely taught and the limited precision implementation skills that are commonly required in fixed point processors and field programmable gate arrays FPGAs These skills are often neglected at the university level particularly for undergraduates We have attempted to create a resource both for a DSP elective course and for the practicing engineer with a need to understand fixed point implementation Although we assume a background in DSP Chapter 2 contains a review of basic theory and Chapter 3 reviews random processes to support the noise model of quantization error Chapter 4 details the binary arithmetic that underlies fixed point processors and then introduces fractional format for binary numbers Chapter 5 covers the noise model for quantization error and the effects of coefficient quantization in filters Because of the numerical sensitivity of IIR filters they are used extensively as an example system in both Chapters 5 and 6 Fortunately the principles of dealing with limited precision can be applied to a wide variety of numerically sensitive systems not just IIR filters Chapter 6 discusses the problems of product roundoff error and various

methods of scaling to avoid overflow Chapter 7 discusses limit cycle effects and a few common methods for minimizing them There are a number of simple exercises integrated into the text to allow you to test your understanding Answers to the exercises are included in the footnotes A number of MATLAB examples are provided in the text They generally assume access to the Fixed Point Toolbox If you lack access to this software consider either purchasing or requesting an evaluation license from The Mathworks The code listed in the text and other helpful MATLAB code is also available at <http://www.morganclaypool.com/page/padgett> and <http://www.rose-hulman.edu/padgett/fpsp> You will also find MATLAB exercises designed to demonstrate each of the four types of error discussed in Chapters 5 and 6 Simulink examples are also provided on the web site Table of Contents Getting Started DSP Concepts Random Processes and Noise Fixed Point Numbers Quantization Effects Data and Coefficients Quantization Effects Round Off Noise and Overflow Limit Cycles [MATLAB und Tools](#) Josef Hoffmann,Urban Brunner,2002 **Nonlinear Image Processing** Giovanni Sicuranza,2001 This state of the art book deals with the most important aspects of non linear imaging challenges The need for engineering and mathematical methods is essential for defining non linear effects involved in such areas as computer vision optical imaging computer pattern recognition and industrial automation challenges **High-Level Synthesis** Philippe Coussy,Adam Morawiec,2008-08-01 This book presents an excellent collection of contributions addressing different aspects of high level synthesis from both industry and academia It includes an overview of available EDA tool solutions and their applicability to design problems **Encyclopedia of Information Science and Technology** Mehdi Khosrow-Pour,Mehdi Khosrowpour,2009 This set of books represents a detailed compendium of authoritative research based entries that define the contemporary state of knowledge on technology Provided by publisher [Design of Very High-Frequency Multirate Switched-Capacitor Circuits](#) Ben U Seng Pan,Rui Paulo da Silva Martins,Jose de Albuquerque Epifanio da Franca,2006-07-02 Design of Very High Frequency Multirate Switched Capacitor Circuits presents the theory and the corresponding CMOS implementation of the novel multirate sampled data analog interpolation technique which has its great potential on very high frequency analog frond end filtering due to its inherent dual advantage of reducing the speed of data converters and DSP core together with the specification relaxation of the post continuous time filtering This technique completely eliminates the traditional phenomenon of sampled and hold frequency shaping at the lower input sampling rate Also in order to tackle physical IC imperfections at very high frequency the state of the art circuit design and layout techniques for high speed Switched Capacitor SC circuits are comprehensively discussed Optimum circuit architecture tradeoff analysis Simple speed and power trade off analysis of active elements High order filtering response accuracy with respect to capacitor ratio mismatches Time interleaved effect with respect to gain and offset mismatch Time interleaved effect with respect to timing skew and random jitter with non uniformly holding Stage noise analysis and allocation scheme Substrate and supply noise reduction Gain and offset compensation techniques High bandwidth low power amplifier design and layout Very low timing

skew multiphase generation Two tailor made optimum design examples in CMOS are presented The first one achieves a 3 stage 8 fold SC interpolating filter with 5 5MHz bandwidth and 108MHz output sampling rate for a NTSC PAL CCIR 601 digital video at 3 V Another is a 15 tap 57MHz SC FIR bandpass interpolating filter with 4 fold sampling rate increase to 320MHz and the first time embedded frequency band up translation for DDFS system at 2 5V The corresponding chip prototype achieves so far the highest operating frequency highest filter order and highest center frequency with highestdynamic range under the lowest supply voltage when compared to the previously reported high frequency SC filters in CMOS

The Nonuniform Discrete Fourier Transform and Its Applications in Signal Processing Sonali Bagchi, Sanjit K. Mitra, 2012-12-06 The growth in the field of digital signal processing began with the simulation of continuous time systems in the 1950s even though the origin of the field can be traced back to 400 years when methods were developed to solve numerically problems such as interpolation and integration During the last 40 years there have been phenomenal advances in the theory and application of digital signal processing In many applications the representation of a discrete time signal or a sys tem in the frequency domain is of interest To this end the discrete time Fourier transform DTFT and the z transform are often used In the case of a discrete time signal of finite length the most widely used frequency domain representation is the discrete Fourier transform DFT which results in a finite length sequence in the frequency domain The DFT is simply composed of the samples of the DTFT of the sequence at equally spaced frequency points or equivalently the samples of its z transform at equally spaced points on the unit circle The DFT provides information about the spectral contents of the signal at equally spaced discrete frequency points and thus can be used for spectral analysis of signals Various techniques commonly known as the fast Fourier transform FFT algorithms have been advanced for the efficient computation of the DFT An important tool in digital signal processing is the linear convolution of two finite length signals which often can be implemented very efficiently using the DFT

Multidimensional Processing of Video Signals Giovanni L. Sicuranza, Sanjit K. Mitra, 2012-12-06 A color time varying image can be described as a three dimensional vector representing the colors in an appropriate color space defined on a three dimensional spatiotemporal space In conventional analog television a one dimensional signal suitable for transmission over a communication channel is obtained by sampling the scene in the vertical and tem poral directions and by frequency multiplexing the luminance and chrominance informa tion In digital processing and transmission systems sampling is applied in the horizontal direction too on a signal which has been already scanned in the vertical and temporal directions or directly in three dimensions when using some solid state sensor As a conse quence in recent years it has been considered quite natural to assess the potential advan tages arising from an entire multidimensional approach to the processing of video signals As a simple but significant example a composite color video signal such as the conven tional PAL or NTSC signal possesses a three dimensional spectrum which by using suitable three dimensional filters permits horizontal sampling at a rate which is less than that re quired for correctly sampling the equivalent one dimensional signal More recently it has been widely recognized that the improvement of the picture quality in current and advanced television systems requires well chosen signal processing algorithms which are multidimen sional in nature within the demanding constraints of a real time implementation
