Environmental Applications of Digital Terrain Modeling John P. Wilson, 2018-02-15 A digital elevation model DEM is a digital representation of ground surface topography or terrain It is also widely known as a digital terrain model DTM A DEM can be represented as a raster a grid of squares or as a vector based triangular irregular network TIN DEMs are commonly built using remote sensing techniques but they may also be built from land surveying DEMs are used often in geographic information systems and are the most common basis for digitally produced relief maps The terrain surface can be described as comprising of two different elements random and systematic The random stochastic elements are the continuous surfaces with continuously varying relief It would take an endless number of points to describe exactly the random terrain shapes but these can be described in practice with a network of point It is usual to use a network that creates sloping triangles or regular quadrants This book examines how the methods and data sources used to generate DEMs and calculate land surface parameters have changed over the past 25 years The primary goal is to describe the state of the art for a typical digital terrain modeling workflow that starts with data capture continues with data preprocessing and DEM generation and concludes with the calculation of one or more primary and secondary land surface parameters Taken as a whole this book covers the basic theory behind the methods the instrumentation analysis and interpretation that are embedded in the modern digital terrain modeling workflow the strengths and weaknesses of the various methods that the terrain analyst must choose among typical applications of the results emanating from these terrain modeling workflows and future directions This book is intended for researchers and practitioners who wish to use DEMs land surface parameters land surface objects and landforms in environmental projects The book will also be valuable as a reference text for environmental scientists who are specialists in related fields and wish to integrate these kinds of digital terrain workflows and outputs into

their own specialized work environments

Rivers of Europe
Klement Tockner, Christiane Zarfl, Christopher T. Robinson, 2021-11-10. Rivers of Europe Second Edition presents the latest update on the only primary source of complete and comparative baseline data on the biological and hydrological characteristics of more than 180 of the highest profile rivers in Europe. With even more full color photographs and maps, the book includes conservation information on current patterns of river use and the extent to which human society has exploited and impacted them. Each chapter includes up to 10 featured rivers with detailed information on their physiography, hydrology, ecology, biodiversity, and human impacts. Rivers selected for specific coverage include the largest, the most natural, and those most affected by humans. This book provides the most comprehensive information ecologists and conservation managers need to better assess their management and meet the EU legislative good governance targets. Includes comparison photos of rivers along with information on the history and management of each river. Presents summary information on hydrological, ecological, and freshwater biodiversity patterns and trends of each river. Highlights environmental issues of great importance to citizens and governments, including fragmentation by dams, pollution, introduction of nonnative species, and reductions in biodiversity.

Rilevamento geomorfologico e cartografia
Maurizio D'Orefice, Roberto Gracioti, 2015-02-10T15:00:00+01:00. Negli ultimi anni si sta assistendo a un crescente interesse per il rilevamento geomorfologico non solo nell'ambito dell'insegnamento universitario ma anche da parte delle istituzioni tecniche territoriali e del mondo professionale. Dando per acquisite le principali nozioni fondamentali, gli autori hanno cercato di ridurre all'essenziale le definizioni soffermandosi su questioni concrete e applicative. L'obiettivo: quello di fornire una serie di indicazioni pratiche che possono risultare di utilit  agli operatori del settore e costituire una guida da adottare per il rilevamento geomorfologico. A questo proposito vengono richiamati elementi di fotointerpretazione e fotogrammetria e sono affrontate le principali problematiche inerenti all'informatizzazione dei dati per la realizzazione di carte digitali. Infine vengono riportate le indicazioni per la stesura di note esplicative e per la lettura e l'interpretazione delle carte geomorfologiche. Il testo   destinato agli studenti universitari rivolto anche a coloro che si apprestano a sostenere l'Esame di Stato per l'abilitazione all'esercizio della professione di geologo ai professionisti che affrontano le problematiche connesse alla gestione del territorio e agli specialisti che operano nel campo delle discipline forensi.
