IIR filters We examine linear time invariant systems starting with the difference equation and applying the z transform to produce a range of filter type i e low pass high pass and bandpass The important concept of convolution is examined and here we demonstrate the usefulness of the log command in Probe for giving the correct display to demonstrate the flip n slip method Digital oscillators including quadrature carrier generation are then examined Several filter design methods are considered and include the bilinear transform impulse invariant and window techniques Included also is a treatment of the raised cosine family of filters A range of DSP applications are then considered and include the Hilbert transform single sideband modulator using the Hilbert transform and quad oscillators integrators and differentiators Decimation and interpolation are simulated to demonstrate the usefulness of the multi sampling environment Decimation is also applied in a treatment on digital receivers Lastly we look at some musical applications for DSP such as reverberation echo using real world signals imported into PSpice using the program Wav2Ascii The zero forcing equalizer is dealt with in a simplistic manner and illustrates the effectiveness of equalizing signals in a receiver after transmission
