Determination Of Surface Pka Values Of Surface Confined:

Determination of Surface PKa Values of Surface-Confined Molecules Derivatized with PH-Sensitive Pendant Groups, 1992 Two methods for in situ electrochemical measurements of surface pKa values are reported. The methods are applied to surface confined monolayers consisting of organomercaptan molecules derivatized with pH sensitive pendant groups. The first technique relies upon pH dependent electrostatic binding of redox probe molecules to the charged monolayer surface; the surface concentration of the probe molecules reflects the degree of surface protonation. The second method relates the differential capacitance of the monolayer modified electrode surface to the surface pKa. The two methods yield essentially identical results and are consistent with a recently developed theoretical model. The surface pKa values of 4-mercaptopyridine and 4-aminothiophenol are 3.7 and 5.7 respectively.
