

Diffusion Through A Membrane (STATE LAB)

In the **Final State**.... Iodine enters the cell and Glucose leaves the cell. Starch cannot leave the cell, since Starch molecules are too large. The cell turns a blue/black color due to the iodine (Starch indicator) and the Starch reacting with each other. Starch (milky white) + starch indicator (brown) = blue-black color. The inside of the bag turns blue-black while the outside stays brown, proving that indicator went in, but starch did not leave.

Glucose indicator (Benedict's) (blue) + glucose (clear) + HEAT = green, brown, red, or orange

Diffusion - movement of molecules from a region of high concentration to a region of low concentration - no energy needed (passive transport)

Osmosis - diffusion of water across a semipermeable cell membrane from region of high concentration to a region of low concentration - no energy needed (passive transport)

Onion Slide: Make a wet mount slide of a thin section of red onion cells. A small piece is placed in a drop of water on a microscope slide. A cover slip is placed on top by touching it to the water at an angle, and then carefully placing it on the specimen, trying not to get air bubbles underneath.

You should observe the following:

Place a 10% salt solution under the cover slip. This is done by putting a drop of salt solution next to one edge of the cover slip.

sequestration in a subsurface geologic formation In general membrane gas separation can find a large room of application in flue gas To achieve the development of this technology on a larger scale than which is possible in the lab we have to use membrane engineering Consequently greater emphasis is placed on novel materials for gas separation Possible design strategies and role of novel materials are discussed Additionally the latest progress in design and preparation of asymmetric membranes for natural gas purification are highlighted In fact further development should focus on module and process design in order to bring gas separation membrane technology into commercial application Therefore the keys issues to propel current research towards industrial application are examined Besides the feasibility of implementing polyimide membrane for CO₂ removal under real industrial conditions and its economic viability are highlighted In order to exhibit excellent film forming properties zeolite membrane and cellulose acetate butyrate membrane are addressed Interestingly it was found that the most accurate theoretical three phase model is arguably revised Pal model with average percentage error of 0.74%
