Design of Very High-Frequency Multirate Switched-Capacitor Circuits Ben U. Seng Pan, Rui Paulo da Silva Martins, Jose de Albuquerque Epifanio da Franca, 2006-07-02 Design of Very High Frequency Multirate Switched Capacitor Circuits presents the theory and the corresponding CMOS implementation of the novel multirate sampled data analog interpolation technique which has its great potential on very high frequency analog front end filtering due to its inherent dual advantage of reducing the speed of data converters and DSP core together with the specification relaxation of the post continuous time filtering This technique completely eliminates the traditional phenomenon of sampled and hold frequency shaping at the lower input sampling rate Also in order to tackle physical IC imperfections at very high frequency the state of the art circuit design and layout techniques for high speed Switched Capacitor SC circuits are comprehensively discussed Optimum circuit architecture tradeoff analysis Simple speed and power trade off analysis of active elements High order filtering response accuracy with respect to capacitor ratio mismatches Time interleaved effect with respect to gain and offset mismatch Time interleaved effect with respect to timing skew and random jitter with non uniformly holding Stage noise analysis and allocation scheme

Substrate and supply noise reduction Gain and offset compensation techniques High bandwidth low power amplifier design and layout Very low timing skew multiphase generation Two tailor made optimum design examples in CMOS are presented The first one achieves a 3 stage 8 fold SC interpolating filter with 5.5MHz bandwidth and 108MHz output sampling rate for a NTSC PAL CCIR 601 digital video at 3 V Another is a 15 tap 57MHz SC FIR bandpass interpolating filter with 4 fold sampling rate increase to 320MHz and the first time embedded frequency band up translation for DDFS system at 2.5V The corresponding chip prototype achieves so far the highest operating frequency highest filter order and highest center frequency with highest dynamic range under the lowest supply voltage when compared to the previously reported high frequency SC filters in CMOS

Digital Filters Using MATLAB Lars Wanhammar, Tapio Saramäki, 2020-02-18 This textbook provides comprehensive coverage for courses in the basics of design and implementation of digital filters The book assumes only basic knowledge in digital signal processing and covers state of the art methods for digital filter design and provides a simple route for the readers to design their own filters The advanced mathematics that is required for the filter design is minimized by providing an extensive MATLAB toolbox with over 300 files The book presents over 200 design examples with MATLAB code and over 300 problems to be solved by the reader The students can design and modify the code for their use The book and the design examples cover almost all known design methods of frequency selective digital filters as well as some of the authors own unique techniques
