The Quintessential PIC® Microcontroller Sid Katzen, 2013-03-09 Microprocessors and their microcontroller derivatives are a ubiquitous if rather invisible part of the infrastructure of our 21st century electronic and communications society In 1998 it was reckoned that hidden in every home were about 100 microcontrollers and microprocessors in the silling birthday card washing machine microwave oven television controller telephone personal computer and so on About 20 more lurked in the average family car For example monitoring in tire radio pressure sensors and displaying critical data through the car area network CAN Around 4 billion such devices are sold each year to implement the intelligence of these smart electronic devices ranging from smart egg timers through aircraft management systems The evolution of the microprocessor from the first Intel device introduced 30 years ago in 1971 has revolutionised the structure of society effectively creating the second smart industrial revolution coming to fruition at the beginning of the 21st century Although the microprocessor is better known in its guise of powering the ubiquitous PC in which raw computing power is the goal sales of such microprocessors as the Intel Pentium represent only around 2% of total volume The vast majority of sales are of low cost microcontrollers embedded into a dedicated function digital electronic device such as the smart card Here the emphasis is the integration of the core processor with memory and input output resources in the one chip This integrated computing system is known as a microcontroller

Intelligent Engineering Systems and Computational Cybernetics J.A. Tenreiro Machado, Béla Pátkai, Imre J. Rudas, 2008-12-18 Engineering practice often has to deal with complex systems of multiple variable and multiple parameter models almost always with strong non linear coupling The conventional analytical techniques based approaches for describing and predicting the behaviour of such systems in many cases are doomed to failure from the outset even in the phase of the construction of a more or less appropriate mathematical model These approaches normally are too categorical in the sense that in the name of modelling accuracy they try to describe all the structural details of the real physical system to be modelled This can significantly increase the intricacy of the model and may result in a enormous computational burden without achieving considerable improvement of the solution The best paradigm exemplifying this situation may be the classic perturbation theory the less significant the achievable correction the more work has to be invested to obtain it A further important component of machine intelligence is a kind of structural uniformity giving room and possibility to model arbitrary particular details a priori not specified and unknown This idea is similar to the ready to wear industry which introduced products which can be slightly modified later on in contrast to tailor made creations aiming at maximum accuracy from the beginning These subsequent corrections can be carried out by machines automatically This learning ability is a key element of machine intelligence The past decade confirmed that the view of typical components of the present soft computing as fuzzy logic neural computing evolutionary computation and probabilistic reasoning are of complementary nature and that the best results can be applied by their combined application Today the two complementary branches of Machine Intelligence that is Artificial Intelligence and Computational Intelligence serve as the basis of Intelligent Engineering Systems The huge number of scientific results published in Journal and conference proceedings worldwide substantiates this statement The present book contains several articles taking different viewpoints in the field of intelligent systems
