Design of an Intelligent Embedded System for Condition Monitoring of an Industrial Robot Alaa Abdulhady Jaber,2016-09-08 This thesis introduces a successfully designed and commissioned intelligent health monitoring system

specifically for use on any industrial robot which is able to predict the onset of faults in the joints of the geared transmissions. However, the developed embedded wireless condition monitoring system leads itself very well for applications on any power transmission equipment in which the loads and speeds are not constant and access is restricted. As such, this provides significant scope for future development. Three significant achievements are presented in this thesis: First, the development of a condition monitoring algorithm based on vibration analysis of an industrial robot for fault detection and diagnosis. The combined use of a statistical control chart with time domain signal analysis for detecting a fault via an arm mounted wireless processor system represents the first stage of fault detection. Second, the design and development of a sophisticated embedded microprocessor base station for online implementation of the intelligent condition monitoring algorithm, and third, the implementation of a discrete wavelet transform using an artificial neural network with statistical feature extraction for robot fault diagnosis in which the vibration signals are first decomposed into eight levels of wavelet coefficients.

Fault Diagnosis Józef Korbicz, Jan M. Koscielny, Zdzisław Kowalczyk, Wojciech Cholewa, 2012-12-06 All real systems in nature physical biological and engineering ones can malfunction and fail due to faults in their components Logically the chances for malfunctions increase with the systems complexity The complexity of engineering systems is permanently growing due to their growing size and the degree of automation and accordingly increasing is the danger of failing and aggravating their impact for man and the environment Therefore in the design and operation of engineering systems increased attention has to be paid to reliability safety and fault tolerance But it is obvious that compared to the high standard of perfection that nature has achieved with its self healing and self repairing capabilities in complex biological organisms fault management in engineering systems is far behind the standards of their technological achievements it is still in its

infancy and tremendous work is left to be done In technical control systems defects may happen in sensors actuators components of the controlled object the plant or in the hardware or soft ware of the control framework Such defects in the components may develop into a failure of the whole system This effect can easily be amplified by the closed loop but the closed loop may also hide an incipient fault from being observed until a situation has occurred in which the failing of the whole system has become unavoidable *Directory of Postgraduate Studies 2002* Hobsons Publishing, PLC,2001
