Rydstad, Günther Schröder, 2012-12-06 It is the objective of the series II Materials Research and Engineering II to publish information on technical facts and processes together with specific scientific models and theories Fundamental considerations assist in the recognition of the origin of properties and the roots of processes By providing a higher level of understanding such considerations form the basis for further improving the quality of both traditional and future engineering materials as well as the efficiency of industrial operations In a more general sense theory helps to integrate facts into a framework which ties relations between physical equilibria and mechanisms on the one hand product development and economical competition on the other Aspects of environmental compatibility conservation of resources and of socio cultural interaction form the final horizon a subject treated in the first II volume of this series II Materials in World Perspective The four authors of the present book endeavor to present a comprehensive picture of process modelling in the important field of metal forming and thermomechanical treatment The reader will be introduced to the rapidly growing new field of application of computer aided numerical methods to the quantitative simulation of complex technical processes Extensive use is made of the state of scientific knowledge related to materials behavior under mechanical stress and thermal treatment **Flexible Metal Forming Technologies** Xunzhong Guo, 2022-08-23 This book systematically introduces the principles of flexible forming technologies to manufacture thin walled complex shaped components the mechanism of controlling the material flow the design and the configuration of flexible forming technologies equipment and tools It covers new technologies and new processes for forming hollow components and relevant research on forming mechanisms deformation laws and defect control with examples from practical applications It will be a useful reference for researchers engineers graduate and undergraduate students in aerospace nuclear railway vehicle and petrochemical engineering etc **Handbook of Thermal Process Modeling Steels** Cemil Hakan Gur, Jiansheng Pan, 2008-12-22 An Emerging Tool for Pioneering Engineers Co published by the International Federation of Heat Treatment and Surface Engineering Thermal processing is a highly precise science that does not easily lend itself to improvements through modeling as the computations required to attain an accurate prediction of the microstructure and properties of work pieces is sophisticated beyond the capacity of human calculation Over the years any developments in thermal processes relied largely on empiricism and traditional practice but advancements in computer technology are beginning to change this Enhances the quest for process

optimization Comprehensive and authoritative the Handbook of Thermal Process Modeling of Steels provides practicing engineers with the first complete resource that meets the needs of both those new to modeling and those hoping to profit from advances in the field Written by those with practical experience it demonstrates what is involved in predicting material response under industrial rather than laboratory conditions and consequently gives heightened insight into the physical origins of various aspects of materials behavior Encourages both the understanding and the use of real time process control Before the advent of sophisticated computers the errors inherent in computational predictions made modeling an ineffective gamble rather than a cost saving tool Today modeling shows great promise in both materials performance improvements and process cost reduction The basic mathematical models for thermal processing simulation gradually introduced to date have yielded enormous advantages for some engineering applications however much research needs to be accomplished as existing models remain highly simplified by comparison with real commercial thermal processes Yet this is quickly changing

Ultimately those engineers who can move this tool of improvement out of the lab and onto the factory floor will discover vast opportunities to gain a competitive edge

Modelling and Simulation of Sheet Metal Forming Processes Marta C. Oliveira, José Valdemar Fernandes, 2020-04-22 The numerical simulation of sheet metal forming processes has become an indispensable tool for the design of components and their forming processes This

role was attained due to the huge impact in reducing time to market and the cost of developing new components in industries ranging from automotive to packing as well as enabling an improved understanding of the deformation mechanisms and their interaction with process parameters. Despite being a consolidated tool its potential for application continues to be discovered with the continuous need to simulate more complex processes including the integration of the various processes involved in the production of a sheet metal component and the analysis of in service behavior. The quest for more robust and sustainable processes has also changed its deterministic character into stochastic to be able to consider the scatter in mechanical properties induced by previous manufacturing processes. Faced with these challenges this Special Issue presents scientific advances in the development of numerical tools that improve the prediction results for conventional forming process enable the development of new forming processes or contribute to the integration of several manufacturing processes highlighting the growing multidisciplinary characteristic of this field.

Modeling of Metal Forming and Machining Processes

Prakash Mahadeo Dixit, U.S. Dixit, 2008-05-14 The use of computational techniques is increasing day by day in the manufacturing sector. Process modeling and optimization with the help of computers can reduce expensive and time consuming experiments for manufacturing good quality products. Metal forming and machining are two prominent manufacturing processes. Both of these processes involve large deformation of elasto plastic materials due to applied loads. In metal forming the material is plastically deformed without causing fracture. On the other hand in machining the material is deformed till fracture in order to remove material in the form of chips. To understand the physics of metal forming and machining processes one needs to understand the kinematics of large deformation, dependence of deformation and its rate on displacement as well as the constitutive behavior of elasto plastic materials, dependence of internal forces on deformation and its rate. Once the physics is understood these phenomena have to be converted to mathematical relations in the form of differential equations. The interaction of the work piece with the tools, dies and other surroundings also needs to be expressed in a mathematical form known as the boundary and initial conditions. In this book the first four chapters essentially discuss the physics of metal forming and machining processes. The physical behavior of the work piece during the processes is modeled in the form of differential equations and boundary and initial conditions.

Process Control for Sheet-Metal Stamping Yongseob Lim, Ravinder Venugopal, A Galip Ulsoy, 2013-12-12 Process Control for Sheet Metal Stamping presents a comprehensive and structured approach to the design and implementation of controllers for the sheet metal stamping process. The use of process control for sheet metal stamping greatly reduces defects in deep drawn parts and can also yield large material savings from reduced scrap. Sheet metal forming is a complex process and most often characterized by partial differential equations that are numerically solved using finite element techniques. In this book, twenty years of academic research are reviewed and the resulting technology transitioned to the industrial environment. The sheet metal stamping process is modeled in a manner suitable for multiple input multiple output control system design with commercially available sensors and actuators. These models are then used to design adaptive controllers and real time controller implementation is discussed. Finally, experimental results from actual shop floor deployment are presented along with ideas for further improvement of the technology. Process Control for Sheet Metal Stamping allows the reader to design and implement process controllers in a typical manufacturing environment by retrofitting standard hydraulic or mechanical stamping presses and as such will be of interest to practising engineers working in metal working automotive and aeronautical industries. Academic researchers studying improvements in process control and how these affect the industries in which they are applied will also find the text of value.
