## **Pricing And Hedging Asian Style Options On Energy:**

*Pricing and Hedging Asian-Style Options in Energy* Fred Espen Benth, 2014 We solve the problem of pricing and hedging Asian style options on energy with a quadratic risk criterion when trading in the underlying future is restricted Liquid trading in the future is only possible up to the start of a so called delivery period After the start of the delivery period the hedge positions can not be adjusted anymore until maturity This reflects the trading situation at the Nordic energy market Nord Pool for example We show that there exists a unique solution to this combined continuous discrete quadratic hedging problem if the future price process is a special semimartingale with bounded mean variance tradeoff Additionally under the assumption that the future price process is a local martingale the hedge positions before the averaging period are inherited from the market specification without trading restriction As an application we consider three models and derive their quadratic hedge positions in explicit form a simple Black Scholes model with time dependent volatility the stochastic volatility model of Barndorff Nielsen and Shephard and an exponential additive model Based on an exponential spot price model driven by two NIG levy processes we determine an exponential additive model for the future price by moment matching techniques We calculate hedge positions and determine the quadratic hedge error in a simulation study Energy Hedging in Asia: Market Structure and Trading Opportunities P. Fusaro, T. James, 2005-08-02 This book focuses on the latest developments in the Asia Pacific community in terms of how deregulation and privatization are bringing more risk to energy companies In the light of these market changes interest in energy risk management has grown substantially and is becoming a fiduciary responsibility of energy companies As energy trading power exchanges and hedging techniques establish themselves in the oil power and gas sectors so then do newer derivatives markets emerge in LNG hedging weather derivatives and freight hedging Fusaro and James as seasoned market practitioners in the region focus on these market changes and examine the future of Asian energy hedging **Commodity Option Pricing** Iain J. **Related Markets** Fred Espen Benth,Jurate Saltyte Benth,Steen Koekebakker,2008 The markets for electricity gas and

temperature have distinctive features which provide the focus for countless studies. For instance, electricity and gas prices may soar several magnitudes above their normal levels within a short time due to imbalances in supply and demand, yielding what is known as spikes in the spot prices. The markets are also largely influenced by seasons since power demand for heating and cooling varies over the year. The incompleteness of the markets due to nonstorability of electricity and temperature as well as limited storage capacity of gas makes spot forward hedging impossible. Moreover, futures contracts are typically settled over a time period rather than at a fixed date. All these aspects of the markets create new challenges when analyzing price dynamics of spot, futures, and other derivatives. This book provides a concise and rigorous treatment on the stochastic modeling of energy markets. Ornstein–Uhlenbeck processes are described as the basic modeling tool for spot price dynamics where innovations are driven by time inhomogeneous jump processes. Temperature futures are studied based on a continuous higher order autoregressive model for the temperature dynamics. The theory presented here pays special attention to the seasonality of volatility and the Samuelson effect. Empirical studies using data from electricity, temperature, and gas markets are given to link theory to practice.
