the context of impulse control and some simple rules currently used in practice are justified Chapter 2 introduces some of the classical static problems which are preliminary to the dynamic models of interest in inventory control This book is not a general text on control theory and dynamic programming in that the systems dynamics are mostly limited to inventory models For these models however it seeks to be as comprehensive as possible although finite horizon models in discrete time are not developed since they are largely described in existing literature On the other hand the ergodic control problem is considered in detail and probabilistic proofs as well as analytical proofs are provided The techniques developed in this work can be extended to more complex models covering additional aspects of inventory control
